The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable.* The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Gluyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on a large scale. 2v20-my

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed,

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

PRACTICAL AND ANALYTICAL CHEMISTS,

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President..........................SAMUEL MERRITT.
Vice-President.....................MICHAEL REESE.
Treasurer..........................J. SELIGMAN & CO.
Secretary and General Agent.........W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel,

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

W. K. VAN ALEN,

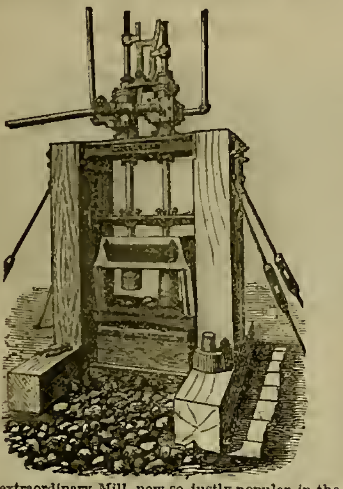
Machinery.

THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

Boiler Scraper and Tube Cleaner.

The Most Complete and Perfect Instrument of the kind Invented.

SIZES TO SUIT ALL TUBULAR BOILERS.

They cost but a trifle, and are handy as well as economical. For further particulars, or for the purchase of Scrapers, address or call on

McAFFEE, SPIERS & CO.,
6v20 Howard street, near Fremont, San Francisco.

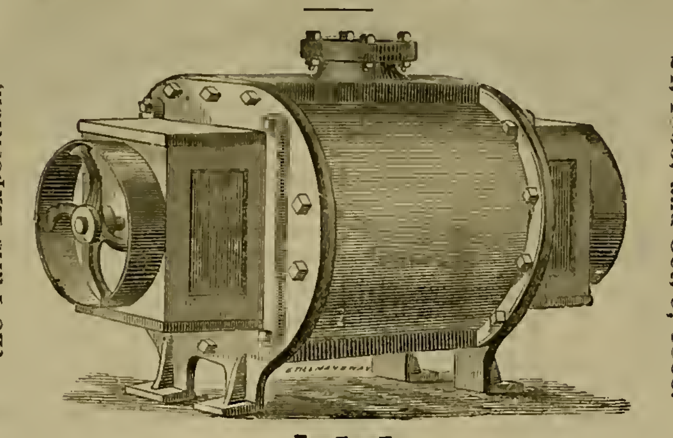
Scientific Press.—The title of the Mining and Scientific Press, published by Dewey & Co., has been changed to the Scientific Press. This is one of the most valuable of our exchanges, and we are pleased to notice the great improvements made in it the past year. On the 1st of January it began a new volume, entering upon its tenth year.—*San Bernardino Guardian.*

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

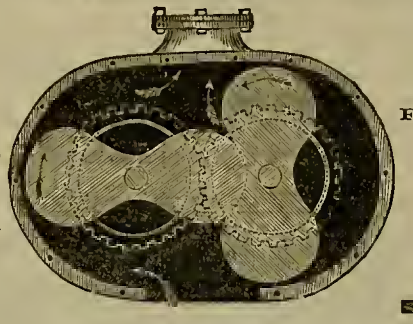
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

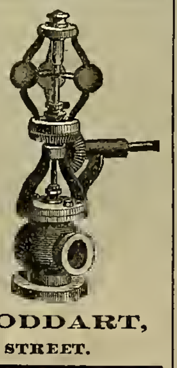
CONDENSERS.

DAVID STODDART,

114 BEALE STREET.



VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 220 Fremont street,
1v1 San Francisco.

Our Home Physician,

By GEO. M. BEARD, A. M., M. D., of New York. Its superior merits are endorsed by the Scientific American, Rural New-Yorker, leading medical journals and physicians of established reputation at the East and on the Pacific coast. Copyrighted 1869. The only complete Family Medical Book written since 1860. Send for circular containing extracts from author's introductory, testimonials, etc. Address, WESTERN PUBLISHING AGENCY, 411 Kearny street, San Francisco. CROSS' COMBINED

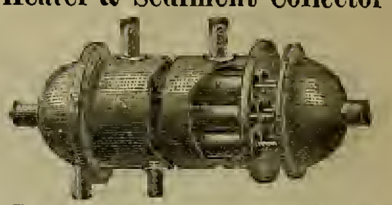
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructore.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturere of all kinds of

Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint. San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adue, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect,
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

The Scientific Press,

Devoted to SCIENTIFIC AND MECHANICAL PROGRESS, MINING, FARMING AND MECHANIC ARTS, contains more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the PRESS, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries.* The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

DEWEY & CO.

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & CO.,
No. 414 Clay street, S. F.

SCIENTIFIC PRESS.—The S. F. Mining Press has entered upon its twentieth volume with a change of name —Scientific Press. This is a journal devoted mainly to the interests of the miner, farmer and mechanic, and has well sustained its position in all respects. The price has been reduced to $4 per year, and we cannot too highly recommend it to all classes.—*Alpine Chronicle.*

SCIENTIFIC PRESS.

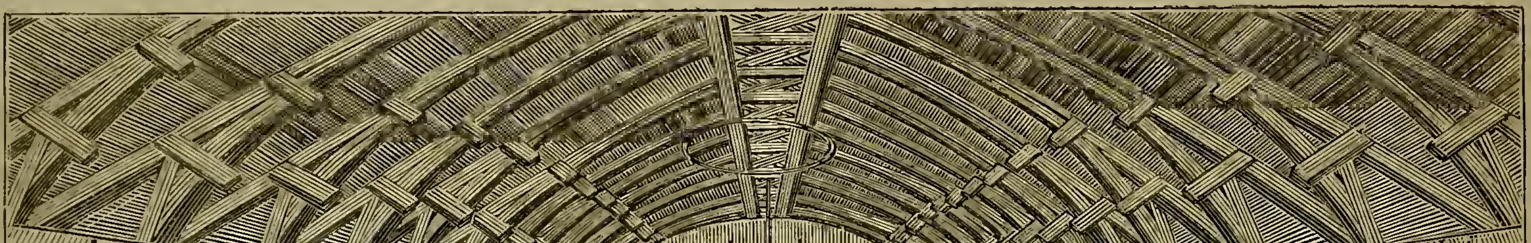
AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, February 26, 1870.

VOLUME XX.
Number 9.



GRAND MUSICAL FESTIVAL, S. F.—INTERIOR OF THE BUILDING.

The Grand Musical Festival.

With this present week commenccs a new era in California. Hitherto on this coast, bnsiness alone has occupied the whole time and attention of onr citizens, and there has been bnt little space given to any extensive cnltivation of the fine arts by the great majority of men. Not that we have had no artistic tastes or talent, for this is evinced by the spirit with which people have entered into this festival; but this ability has been suffered to lie dormant, while our whole attention has been given to the acquisition of wealth. But we believe that henceforth we shall hear more of musical festivals, of art galleries, and of similar evidences of awakened interest in the higher refinements of civilization. Mme. Urso has done more than merely to institute this one celebration. She has laid the foundation of others, and the Pacific Coast will learn to consider her one of the pioneers of high art.

Our Engraving

Presents as fair a representation of the great choir and immense audience as can be given in its space. Althongh execnted in haste, since the opening of the Festival, it enables us to convey a more trnthful idea of the scenes of the week than can be imparted to non-attendants and distant friends by a ay other means.

Origin of the Festival.

On her arrival in San Francisco in November, 1869, Madame Urso was received with the greatest enthusiasm. Surprised and pleased by the warmth of her reception, she determined to find some substantial way of expressing her thanks, and concluded that the best way to earn the gratitude of the people was by attempting to rescue from annihilation one of the proudest institutions of San Francisco—the Mercantile Library. And for this purpose she determined to gather together the talent of the coast aud institute a festival on a grander scale than ever before attempted or even practically thought of here. Within a week from the time when the plan had been fully formed and the offer made by Madame Urso had been accepted by the trustees of the Library, the choruses of this city were rehearsing, and the musical societies of interior towns were enthusiastically responding to the solicitations of Madame Urso's efficient agent, Mr. S. W. Bngbee, to whom mnch credit is due for his exertions in the conception and prosecution of the plan. From every quarter came cordial responses, and delegations frem Sacramento, Stockton, Marysville, San José, Gilroy, Vallejo, Redwood City, Petaluma, Napa, Placerville, and other towns have arrived to swell the numbers furnished from this city, and from even so far East as Virginia City camo a large number of trained musicians.

Chorus and Orchestra.

After summing up the amount of available talent, it was found that the chorus would amount to about 1,200, while the orchestra would number some 150. The orchestra is thns summed up: Condnctor, R. Herold; organist, A. G. Scott. String band: First violins, 16; second violins, 19; violas, 10; violincellos, 5; double basses, 4; flutes, 4; clarionets, 4; oboes, 3; bassoons, 2; horns, 7; cornets, 4; trumpets, 4; trombones, 5; tnbas, 2; kettle drums, 1 set; snare drums, 3; cymbals, 1; triangle, 1; big drum, 1; total, 96. Military bands: Piccolos, 4; E flat clarionets, 6; B flat clarionets, 14; obocs, 2; bassoons, 6; cornets, 8; trnmpets, 8; althorns, 6; French horns, 10; trombones, 8; tubas, 10; double basses, 3; drnms, 3; big drum, 1; cymbals, 1; triangle, 1; total, 91. Thero were, moreover, 30 anvils, which were efficiently manipulated by a detachment of red-shirted firemen, who were among the most enthusiastic. Two thousand children from the public schools, under the management of Prof. E. Knowlton and the leadership of Mr. W. Elliott, rendered several choruses with wonderfnl effect, their clear fresh voices harmonizing most delightfnlly, forming one of the most striking features of the Jubilee.

Ths Big Drum—Artillery Firing by Electricity.

This monster drum was manufactured by Mr. H. M. Balch, and is made of zinc, painted in imitation of California laurel. The head is composed of 23 sheepskins and two calfskins. On one of the heads is painted, "Grand Musical Festival, M. L. A. By Camilla Urso, Feb. 22d, 23d and 24th, 1870." It is eight feet and three inches in diameter, and cost $300.

Communications.

Mills and Mines of Colorado.—No. VI.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Georgetown is situated on a flat, and is surrounded on three sides by very high mountains, bold, though not particularly rugged. It is a place of some 2,000 inhabitants, and is new in appearance, as it is in fact, being only 3½ years old. In a mining sense, it is in the center of the silver mining region.

The Silver Ores.

The silver here is associated with a high percentage of lead, antimony, zincblende and copper, so the ores have to be generally treated by fire. From lots I have seen, the ore is unquestionably rich in silver, and, as a whole, carries a paying percentage, although all ore now worked here must necessarily run not less than $80 per ton to pay expenses of extraction and reduction. The rebellious character of the ore exceeds any that I have seen in Nevada or California. There are three reduction works in the vicinity.

Stewart's Mill

Is situated at the lower end of the town. It is not so particularly interesting as are some facts connected with a new 20-stamp mill to be built by him. We will take the mill first, and then the "facts."

This consists of two reverberatory furnaces, with hearths 8x10 feet, six stamps of 450 pounds weight each, with low mortars, and old-fashioned in every sense; two Blachly pans 5x2 feet; cleaning-up pans, four feet in diameter; retorts of California style; assay offices, melting furnaces, etc., in good and convenient shape.

Now for the facts. Mr. Stewart told me he was particularly desirous of getting machinery for his new 20-stamp mill from California, and sought estimates from there (Pacific Foundry); also from Chicago. The job was a $20,000 one, and he was willing to give a small percentage in favor of California; but when the estimates came in, there was just the difference between Chicago and San Francisco that there was between *currency* and *coin*. So Chicago got the job. But to carry out the estimates, the Chicago foundry had to *send to California for the drafts*.

California vs. the East.

The millmen of Colorado give California credit for building the best machinery, and they will give it the preference at 10 per cent. advance, and with some low figuring on the parts of the San Francisco foundries, there are many things they would order from there. Whether the trade of Colorado, as respects all mining machinery, is worth striving for, in view of the ready completion of the St. Louis & Denver Railroad, is quite a question, as when that is completed, then St. Louis taps Chicago's iron trade. Cheyenne is within three miles of being half way between Chicago and San Francisco. This is the shipping point for Denver and the Colorado mining region. Now, if freight can be so regulated as to be the same, then California will get many a dollar of trade from Colorado, even at a slight advance of cost, independent of Chicago or St. Louis competition. I have not as yet seen all Colorado mills, but I have got to see better ones than I have yet to see anything that comes within gun-shot of a first-class California or Nevada mill.

This sending drafts to Chicago to build California mills by, is using California brains to build up Chicago. Pretty good, when you look at it in that light.

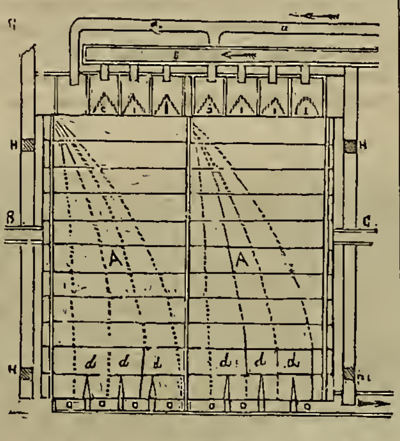
Mr. J. O. Stewart is one of the most successful millmen in this part of the country. He commenced with small works, and felt his way along prudently, and now steps into a big operation, and, I am satisfied, a profitable one, understandingly. The old works produced about $80,000 last year, which speaks well for this mining locality as well as for Mr. S. This country wants some of our dashing Nevada operators here, who have been accustomed to slash out their 300 and 500 tons per day, and having it off in bullion to San Francisco before the next twenty-four hours roll round. The mines are here, the metal is here, but the country wants electrifying by capital, population, experience and pluck.

Dressing of Ores—A Freiberg Process.

[Written for the Scientific Press.]

The Rittinger Percussion Table

Has been carefully experimented with at this mine, and gave very good results. The working, etc., may be understood from the accompanying cut, which gives a view from above. The double-table is divided into two parts, A, A, each of which is eight feet long and four feet wide. By means of four iron rods, it is suspended from the frame-work, H, H. The motion is given by a connection at C with the cams of a shaft, which throw the table to the left, while a spring at B throws it back and against an immovable block, giving it the required shock. The ore and water from the pointed boxes are conveyed through *a* and discharged upon the tables at *c*, *c*, while clear water is conveyed through *b* and discharged at *i*, *i*, *i*. The table being put in motion, and the ore and water introduced, the lighter particles will be carried in a more or less straight direction and discharged at the left hand, while the heavier particles will be thrown more to the right. The dotted lines show the direction taken by various grains. Small movable tongues of wood, *d*, *d*, *d*, are placed at the bottom of the table, and divert the various classes into the respective troughs, o, o′, o″, o‴.



According to the material to be worked, the amount of water, the number and force of the strokes, the inclination of the table, and the number of divisions (or of the tongues, *d*), must be regulated. At the Kur-Prinz five classes were obtained:—pure or nearly pure galena, nearly pure blende, valueless stuff, and two mixtures of galena and blende and of blende and pyrites. It is to be observed here that the galena and the blende are both sold to the smelting works, where zinc is now extracted as well as lead and silver. It was thought that the mixtures could be led upon other tables and readily separated. Very often only three classes are made:—pure ore, worthless earth, and a mixture.

Such a table demands careful attention, which being given, it does its work well. It can work from two and a half to four tons daily; but the middle products must be re-worked on other tables. If two double-tables are used, three of the half-tables can be used on the ore, while the fourth compartment will work their mixed product. The amount of clear water used is very considerable—from one-third to two-thirds cubic feet per minute for each half. It works best with ore-grains of a medium size. At the Kur-Prinz, the loss was reduced to about ten to fifteen per cent. One workman can attend to four or six of these tables, and, if skillful and attentive, can soon learn to regulate everything so as to suit the different kinds of ores, etc. But with a careless workman it is in vain to expect good results. The motive power necessary, and, in general, the expenses of running, are very small.

The experiments at the Kur-Prinz were conducted under the immediate supervision of the foreman, who is exceedingly well versed in all that pertains to his business. He worked separately the ore from the various pointed boxes, keeping, carefully, notes of all the results, and comparing them with the results of other processes. For the very coarse or very fine sands he found the results to be rather unfavorable; but for the medium-sized grains the table acted well. The economy in manual labor was, of course, very large, and the saving of valuable mineral, compared with the carefully-conducted but much more laborious and repeated processes of the common percussion table, was considerable. H.

The Gold Fields of Victoria.—No. 2.

It was thought, eight years ago, in Victoria, that the working of the mines had resulted in a way unfavorable to the miners, that their condition had grown worse instead of improving, that poverty abounded; and statements calculated to drive emigrants away from the colony were common. From figures given, it was calculated that it cost two dollars to extract one from the mines; that, dividing the reported yield of gold by the estimated number of miners, the laborers must receive but the smallest pittance for wages. Our author, to test this thoroughly, visited the oldest mining camps, where it was fair to expect that the worst condition of affairs would exist. His report illustrates the truth of Channing's remark—that, in the hands of an able manipulator, figures may be made to prove anything. Poverty existed—as it exists everywhere; but "improving means and increasing comforts were enjoyed by every industrious and moderately careful digger on every field visited."

Reduction of Wages.

The reduction of wages was held as a proof of the degeneracy of the laborers; but this had been accompanied by reduction in the cost of living. All the necessities of life had fallen largely in price, and luxuries had come within the reach of those to whom they were formerly almost debarred. For instance, in the four years previous to 1862, wages had fallen from $20 and $25, to $10 and $12½ per week. In the meantime, board (without lodgings) had fallen from $10 to $4 per week; milk, from 50 to 12 cents per quart; bread, from 37 to 14 cents per 2-pound loaf; butter, from $1 to 37 cents; cabbages, from 67 and 75, to 4 cents apiece; meat fell 50 per cent.; blankets, candles, tea, etc., 15 to 25 per cent.; articles of dress, 50 per cent.; coach fare, previously $32½, fell to about $5¾; machinery castings, from $300 to $120 per ton; the cost of milling from $25 and $30, to $2½ and 3½, etc. "The comparison, in short, reduced itself to this—that wages have fallen little, if at all, below the reduction which has taken place in the comforts and necessaries of life, and those incidental charges on the family purse, which occur, whether its owner is rich or poor.

Social Condition.

But wages alone do not determine wholly the social condition of the miner. In the earlier days, his life was of the very roughest sort; if piles of gold were often gathered, they were almost as often lost in a bar-room "shout," in the rough orgies in which there was little comfort and less of pleasant reminiscence. But a change had now taken place. There was no lack of employment for those who were willing to work. Wives and children were no longer rarities on the gold fields. In the place of hovels, cottages abounded, still partly of canvas perhaps, but yet presenting evidences of taste and comfort. There were gardens, with vegetables for the table; trim walks and beds of flowers denoted feminine influence; supplies of all kinds were easily obtained, roads and railways annihilated the long distances. Reading rooms, Mechanics' Institutes, friendly societies, cricket clubs, volunteer rifle companies existed for the miners' instruction, amusement and benefit. Schools were built and churches erected. "In everything essential to the enjoyment of a settled and contented life, there has been a steady and satisfactory growth. Less money may now pass through the miners' hands, but its purchasing power is as great," while the position and opportunities of the miner are vastly improved.

The State of Things in California.

We have a parallel case in California as far as the hue and cry about the exhaustion of the mines are concerned; and it does appear as if the price of labor would be reduced in the State, whatever our desires and inclinations may be. But on neither point have we just grounds for troubling ourselves. Our mines are *not* exhausted; and the reduction in wages, if it must come, will not prove in the end a real injury to the laborer. We believe that it will result in the opening of more mines, and thus give steady, instead of occasional, employment to the miners; it will cause a corresponding reduction in the cost of living, it will teach him to be less wasteful, and to use his money with more benefit to himself and to the public; it will bring him home comforts; it will tend to legitimate mining, and the *employee will be able to become an employer* to a much greater extent than is now possible, as the miner will be able to work his own mines. We may fairly judge, from what has been the effect in Victoria, of what will be the result on the Pacific coast.

Increase of Moisture on the Plains.

The *Inland Empire* is responsible for the following remarkable statements:

For some time past there has been a question before the people of this basin and of the plains east of the Rocky Mountains, that has as yet failed to be satisfactorily answered. It is—Why are the streams carrying more water than in former years? The great plains are fast losing their arid nature, and through them are running streams in places where twenty years ago there was not a drop of water; and where at that time there were small streams, they are very much enlarged. In many cases this change has been of great value, as it has given to the traveler a supply of water that had previously been denied.

When the first emigrants crossed the plains to California, the great objection urged to the trip was the scarcity of water on the greater part of the route. Within a few years this has been all changed, and in the beds of old streams that were dry when first found, there is now water for all the purposes required. The Laramie plains are not now destitute of water, whereas, some years ago, there was none, and travelers had to carry water when passing over them. There can be no doubt that for the last ten years there has been a continual increase of water throughout the whole desert country between the Missouri and the Sierra Nevada. The Arkansas was dry in 1862 from the Pawnee Fork to the Cimaron Crossing, and previous to that time the Pecos was dried up so that at many places the inhabitants were obliged to dig for water. And the Moro Valley and Plains were at that time almost destitute of vegetation. Now, the vegetation is luxuriant, and it is one of the best wheat-growing sections.

Denver was built on the banks of an extinct creek, which, it was supposed, would remain dry, but after the settlement, to the astonishment of the people, it became quite a stream, and is now crossed by bridges. The Huerfano, the Roya Pecos and others that were dry during the summer months, ten years ago, are now constantly running in fair streams. We are satisfied that along the whole line of the Union Pacific Railroad there is much more moisture in the air now than there was only a few years since. Again, Salt Lake is seven feet higher than it was ten years ago, and is constantly rising; and it has been urged by those who have paid attention to the subject, that the rise of water there would produce a solution of the Mormon question before Congress would act upon it. When the Salt Lake shall rise a few feet higher we shall look for its overflow to reach the Shell creek range, as evidently at one time water did cover what is now only an arid valley, not direct in its course, but cut up with ranges; still the continued valley can be traced. This great increase of water will work a great revolution in the opinions of people as to the capacity of the great plains for agricultural purposes.

The only reason why it has been supposed the great plains cannot be made into good farms has been the lack of water and timber, as the land in richness has no superior. The increase of water of which we have spoken will do away with one objection, and the discovery of coal over a distance east of Salt Lake for over 600 miles, will obviate the other. The man who travels over the Union Pacific roads twenty-five years from this time, will find that the sage brush has given way to crops of all kinds growing in the greatest luxuriance, and that the sturdy farmers with happy homes have taken the place of the wandering red men. In our own State this increase of moisture has been noticed, and the old settlers do not hesitate to say that in many places the streams have increased more than one-fourth in size during the past five years, and in some places where there was no water then, there is now small but constantly running streams.

Mechanical Progress.

Photographing on Canvas.

The *Photographic News* has seen some fine specimens made by Mr. Lothian with Mr. Davies' sizing solution of shellac and gelatin. This is used considerably diluted, for printing on canvas, as a thick film might exfoliate. The formula of Mr. Davies is as follows: "Take four to six grains of gelatin, soak it in an ounce of water for an hour, then melt it gently over a fire, hot plate, or water bath, using a clean earthen pipkin. When fully dissolved, add to it, while yet warm, and stirring it gently during the mixing, from four to six drachms of a solution of white lac in methylated spirit, if for white or pale surfaces; but orange lac will do if the surface be of a darker color. This is made in the proportion of six ounces of spirit to one ounce of lac, and digesting it till fully dissolved. The mixture of the gelatin and gum lac in spirits produces a creamy-looking emulsion, to which is added four grains of chloride of sodium, or a like equivalent of chloride of ammonium or barium, and, when fully dissolved, filter through fine muslin into a clean pipkin, and it is ready for use."

This is diluted with an equal bulk of water or of alcohol and water equal parts, and applied smoothly with a sponge to the canvas previously sponged with methylated spirit. It soon dries. The silver solution is applied with a tuft of cotton wool. The silvered surface being dry, the canvas is placed under a negative and exposed. When sufficiently deeply printed, the canvas is turned up at the edges, and secured at the corners by spring clips, so as to form a dish. Into the dish the hyposulphite fixing solution is poured, and suffered to remain about ten minutes.

Mr. Lothian states that he had arrived at a criterion of perfect fixation. When the surface is so thoroughly permeated by the fixing solution that it felt slightly soft and yielding when pressed by the finger, instead of being perfectly hard and rigid, experience has proved that the image is perfectly fixed.

When the image is fixed, one corner of the canvas is released from the clips; and, after pouring away the hypo., the surface is washed for a quarter of an hour by means of a flexible tube attached to the water pipe, care being taken at no stage of the proceedings to wet the back of the canvas. No toning is necessary, as the image, when fixed only, is of a rich, warm, purple brown tint, well suited to the purposes of the oil painter.

Glue.—The following hints are worth noting by those of our readers who work in wood. We find them in the *Journal of Applied Chemistry:* "Good glue is hard, clear, and free from bad taste and smell. Glue which is easily dissolved in cold water is not strong. Good glue merely swells in cold water, and does not dissolve until it has been heated to nearly the boiling point. One of the characteristics of good glue is its property of gelatinizing, or forming a stiff jelly when cold. The firmer the jelly the better the glue. Very white and colorless glue is by no means the best; but, whatever be the color, see that it is clear. The most common defect in glue is incipient putrefaction. This may occur either at the glue-factory or in the workshop; and in either case is fatal to the strength of the glue. It is easily detected by the smell when it is moistened. The preparation of glue demands care. It should be well soaked in water, but not too long. It should then be melted, great care being taken that it be not burned. Burnt glue is always weak. No more glue should be prepared at any one time than is to be used immediately, and whenever a job requiring extra strength is to be executed, it will always pay to prepare a fresh lot.

General Joiners.—*Engineering* closes an article on this subject,—written to describe a new machine called "Parkinson's Universal Joiner," and to show the advantages which have attended the substitution of wood-working machinery for hand labor,—with the following: "The cost of working this machine has, since its erection, averaged 50*l.* per month less than would have been paid for wages alone, if the work it performs had been done by hand labor at the ordinary piece-work prices. The general joiner and trying-up machine, also, have been found capable, in regular work, of preparing per day the stuff for seventy doors ready for putting together, the daily cost for wages in this case being 8*s.* 9*d.*, or only 1½*d.* per door."

Hardening and Tempering Steel.

At a recent meeting of the Polytechnic Association of the American Institute, this interesting subject was introduced for discussion. We quote some of the points from the *Artisan's* report:

Mr. Phin said: "It is laid down as a rule that all bright steel requires a coating of some description before putting it into the water, especially when the article to be hardened is of large size. Without this precaution it is liable to crack. An illustration of this is, that common turning-tools, hardened with the external skin left by the action of the hammer in shaping them, will always stand better and keep a finer and more certain edge than if ground before hardening, the precaution being taken to heat the steel to the exact temperature required to bring it when cooled to the desired hardness without subsequent tempering. The manner of dipping different articles must be varied according to their shape. Care must also be taken that the water be not intensely cold; for which reason it is best to throw into it burning coals or dip into it a hot iron rod to take off the chill before dipping the steel. In dipping, if the article has a thick and a thin part, the former must go into the water first, and preferably as near the center of the vessel as possible. In case the skin left by the hammer is not retained on the steel, it may be coated with soft soap, blacklead, plumbers' size, etc. For hardening in lead, any of those substances will answer a good purpose, but, when a common fire is used, prussiate of potash is to be preferred. The prussiate, powdered fine, may be sprinkled or sifted uniformly over the surface of the article. It may then be put into the fire, heated to the proper degree, and then plunged into the water, except when the piece of steel is large, in which case a second coating of the prussiate and a supplemental heating before dipping may be advisable."

Mr. Norman Wiard stated that he believed he had discovered the true theory of the hardening and tempering of steel; that these phenomena are due to a "tension" induced by the cooling of what he might be permitted to call the different "stratums" of the material. He instanced, as proving this, a careful experiment made by himself, in which a piece of sheet-steel that readily hardened when plunged edgewise into cold water, had refused to do so when clamped sidewise between two pieces of wet sponge.

Incautious Use of Anti-incrustation Compositions.—The *Mechanics' Magazine* says that the advice often given by the proprietors of boiler compositions, not to blow out the boiler, is dangerous. A recent case is cited, in which the engineer of a first-class boiler, then using one of these compositions, noticed, one morning, that both furnace-crowns were bulging down a little on one side of the center line, though, on looking at his water-gauge, he found that he had a depth of eight or nine inches of water over them. The engineer had the fires at once withdrawn and the steam blown off. It appears that the patentee of the composition had given directions that the boiler should not be blown out until cleaning-time. Therefore it had been worked on, all bottled up, for three hundred and forty hours. The water was drawn from the river, and left a sludgy deposit. This, combining with the composition—which was of a glutinous character—formed, in the absence of blowing out, a coating on the furnace-crowns of an inch thick. It was fortunate that the engineer detected this in time.

A "Variety Machine."—"A. S. Gear, of New Haven, Conn., has recently patented a machine that planes, molds, panels, tenons, and mortises straight and irregular wood-work, and, what is more astonishing, dovetails beautifully, making both tenon and mortise at the same time. It also carves in wood the duplicate of almost any pattern desired, such as images, scrolls, vines, etc. It is very simple in its construction, and is considered the most useful and wonderful invention that has been made in wood-working machinery for a long time."—*Artisan.*

Double Ratchet Brace.—A new brace of English manufacture has "double ratchet teeth pawls and levers, which on being moved from and toward each other simultaneously, impart to the ratchet wheels continuous motion, thereby enabling it to effect its work in half the time of a single brace and drill."

Scientific Progress.

Chemical Geogony.

Our readers will remember the article headed "A Final Zoic Catastrophe," which appeared in our columns some weeks since, condensed from a paper by Prof. Wurtz. The *Chemical Repertory* for Feb. 2d, contains a letter from Prof. T. Sterry Hunt to Prof. W., who has read the paper with much interest, and who agrees with most of the propositions advanced, having in fact maintained them himself for years. He says: "I have maintained that the condition of the cooling globe was one of thorough oxidation, and that all processes of reduction or deoxidation are either directly or indirectly dependent on organic life, to which I ascribed the formation of metallic sulphides and beds of iron ore in rocks then looked upon as azoic."

But upon the point to which we have referred he says: "As regards the final zoic catastrophe, to be brought about by the total elimination of carbonic acid from the atmosphere, its fixation in the form of carbonate of lime, and the consequent extinction of vegetable life, I may suggest that chemical changes going on in the depths of the earth are constantly liberating carbonic acid from its combinations, as shown, not only in volcanic regions, but in many other districts. May not this replace the amount removed from the atmosphere in the state of carbonate of lime, and thus maintain the equilibrium necessary for the preservation of the present order of life on the earth?"

Prof. Wurtz makes his rejoinder in the same number. After paying a high compliment to Prof. Hunt as a brilliant generalizer and illustrious chemist,—and disclaiming that there is no danger that his portion in these grand conclusions shall be overlooked, inasmuch as his discovery of the essential influence of Life in the processes of deoxidation is in itself immortality,—he goes on to claim that, although following in Prof. Hunt's footsteps to a certain extent, he has nevertheless pushed on farther in the path, taking a new point of departure, and seeing things from new points of view. He submits that any *hypothesis* must be a blind guide; and that the *known* should be taken as the starting point. He then names several things in which he differs from Prof. H., from which we quote the one especially in point: "I differ from him in his assumption of mysterious and inexplicable modes of liberation of carbonic acid from unknown materials in the telluric viscera; which liberation is assumed to be competent to compensate the mode of ceaseless exhaustion which I have for the first time pointed out. Even if his hypothesis could be admitted, and it could be shown that rocks not themselves sedimentary, or rather rocks antedating Life, now evolve carbonic acid, which seems incredible, it is still necessary that we admit an *indefinite* continuation of such hypothetical evolution, to establish the idea of the perpetuity of Life upon the Earth."

Anhydrous Nitric Acid.—A new method of preparing this, adopted by Messieurs Odet and Vignon, is described in the *Chemical News.* It consists in causing chloride azotyl to act upon perfectly dry nitrate of silver at from 60° to 70°. Chloride of azotyl is prepared by the action of oxychloride of phosphorus upon nitrate of lead, or nitrate of silver. It is a slightly yellow-colored liquid, boiling at 5°, and not frozen at 31° below zero; in contact with water it is decomposed into nitric and hydrochloric acids. The vapor of this fluid is applied for the decomposition of dry nitrate of silver, in a simple apparatus consisting of U-shaped tubes connected together by means of suitably bent glass tubes. The chloride of azotyl is prepared simultaneously with the anhydrous nitric acid, which is collected in a tube placed in freezing mixture at 25° below zero.

The Corona.—The *Philosophical Magazine* contains a letter from Mr. Winter, announcing his conviction that the polarization of light from the Corona of the Sun, as seen in the total eclipse of 1868, is of such a nature as to prove conclusively that it is due to the reflection of the splendor of the sun's body from a surrounding atmosphere.

Projection of Spectra on a Grand Scale.

Prof. Barker, of New Haven, recently lectured on spectrum analysis in Brooklyn, N. Y. A series of metallic spectra were projected on the screen—says the *Journal of the Franklin Institute*—with a success not before attained, we believe, in this county or abroad. We quote the account of an eye-witness: "The battery consisted of fifty cells of Bunsen, twelve inches high. A Duboscq lantern with his improved lamp, which gives two directions of motion in the carbons, was employed. For holding the substances, pieces of carbon one-half inch square and two inches long, fitting into the socket of the carbon-holder, were used, being hollowed out to receive the metal. The condensing lens was protected by a plate of glass from the fiery rain of melted metal. The slit had a length of one and a half inch and was nearly an eighth broad. The prisms were made of thick glass tube cut obliquely, so as to give prisms of 60°, and having sides of plate glass. They were filled with bisulphide of carbon. * * In this way, a splendid continuous spectrum ten feet long by eighteen inches wide was obtained, overlapping the screen nine feet by three at both ends. There were then projected the spectra of sodium, lithium, magnesium, copper, brass, iron, mercury and thallium, using the metals, except in the case of lithium, where the carbonate was used. The lines were as sharply cut as in the spectroscope. Six lines were observed with sodium, probably those noticed by Wolf and Diacon; three lines with lithium, the blue being gorgeous. The copper bands were beautiful and retained their identity perfectly when the zinc lines in brass were added to them. The numerous lines of iron came out with a surprising minuteness, the dark spaces between them looking in some places like fine black lines. Mercury gave three lines only; one a peculiar light orange-yellow—a sort of nankeen color—the second green, the third a splendid blue-violet."

Mixing Lignite and Crude Petroleum for Fuel.

Prof. Hayes, Massachusetts State Assayer, contributes to the *Chemical Repertory* an article on the Italian lignites. We quote and condense:

Prof. Cassola proposes to mix or saturate the porous lignites with the crude natural bitumens, and burn the nearly dry artificial mixture thus made as coal.

The lignites readily absorbed about twenty per cent. of the semi-fluid hydrocarbon, and the result was not adhesive, and could be quite as comfortably handled as softer varieties of coal. This mixture, by estimation, had a high practical value, and presented the utilization of crude petroleum as fuel, under a new and inviting aspect. * * The bitumens of Southern Italy resemble those of California generally, though their petroleum oil has been drawn from tolerably deep wells, and the latter are therefore adapted to this new use; becoming valuable, not as fuel *per se*, but conferring on a poor hydrous combustible a greatly increased power in producing heat. * * In California, where semi-fluid bitumens exist, the increasing facilities for transportation may allow the value of lignites of that and other States to be greatly increased by the absorption of bitumen, so as to form an artificial fuel, in which the combined water of the lignite will be utilized to form a strongly heating flame, in the otherwise smoke-producing vapors of the bitumen."

Antidote for Carbonic Acid Gas.—Dr. Limousier, of Paris, lately resuscitated a woman who by inhaling the gases of a charcoal fire, had become asphyxiated, or poisoned to a state of insensibility, by causing her to inhale pure oxygen. He made her inhale three gallons the first day, at intervals; on the second day she inhaled six gallons; and on the third day she was completely restored, her blood circulating freely, and every trace of carbonic poisoning having disappeared.

This would seem to suggest the use of pure oxygen as a sanitary agent, in all cases of vital degeneration caused by breathing impure air, and when from any cause the circulating system has become loaded with carbon, whether by breathing impure air, or by the impurities thrown into the circulation by the waste of the system.—*Gas-Light Journal.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Mining Items.—*Miner*, Feb. 12th: Globe tunnel is making good headway, the rock being the best for working yet found. ....Mr. McCarty has perfected his purchase of the Good Hope, and is making arrangements for mining and milling the ore....Schenectady Supt. is putting in sluices, and getting ready to reduce by concentration....M. C. Tunnel No. 3 continues to turn out ore.

Mountain No. 1.—*Chronicle*, 12th: The report of the Supt. for January, shows the length of the tunnel to be 1,795 feet. Thirty feet made during the month.

AMADOR COUNTY.

The Mines.—*Dispatch*, 19th: The Kennedy and Onsida mills continue to hammer away as usual, while the Coney remains in *statu quo.*

BUTTE COUNTY.

Cherokee.—Oroville *Record*, 19th: The placer mines of this section have lain almost entirely idle during the winter. The whole of Table Mountain, from Cherokee to Thompson's Flat, is valuable mining ground, but lacks a full supply of water.

CALAVERAS COUNTY.

No Water.—*Chronicle*, 19th: Those miners who threw up gravel during the summer, out of reach of ditch facilities, relying upon nature for water, have thus far been disappointed, and the prospects are that they will be forced to postpone washing up until next season.

Palomo.—The mill is kept running day and night. The main shaft is sunk to the depth of 300 feet, developing the fact that the vein increases in size and richness.

Angels.—We are informed that all the quartz mills are constantly employed and paying well.

Petticoat.—After a short run, during which second-grade ore was crushed, 150 ounces of amalgam were obtained from the mill recently. First-class rock is now under the stamps.

Nugget.—A nugget of gold, weighing over three dollars, was picked up in Lafayette street, by a little boy, one day this week.

Lower Rich Gulch.—Alexaoder & Co., whose claim is below the Palomo, are working away with energy. Their battery of 10 stamps is kept in constant operation, crushing ore that pays fairly.

EL DORADO COUNTY.

The Placerville *Democrat* of the 19th urges the call of a miners' meeting and the election of a Recorder. The present loose tenure of mining ground retards development, for no one knows how many "original claimants" may spring up if he prospects a lead and strikes anything. So no one prospects.

Improving.—Melton & Morey, from last week's run of their mill at Grizzly Flat, sent down $800 in bullion. This is double the amount sent any previous week.

FRESNO COUNTY.

Quartz.—Mariposa *Gazette*, Feb. 18th, The mill of Harbert & Co., 33 miles from Mariposa, has been in successful operation since December. The company have a 10-foot vein and are down 40 feet. The mill is a 10-stamp steam, situated 400 yards from the mine, with an abundance of wood and water. The rock averages from $15 to $20 to the ton.

MARIPOSA COUNTY.

Started Up.—*Gazette*, 18th: The late rains have furnished sufficient water to set the water-wheel quartz mills in operation. A great deal more rain is needed before many of the placer miners can work for any length of time.

INYO COUNTY.

A Los Angeles telegram of the 19th says 10 tons of base bullion arrived to-day from Cerro Gordo.

NEVADA COUNTY.

Excitement.—Grass Valley *Union*, Feb. 17th: Night before last E. C. Webster & Co. struck bed-rock in their mining shaft on Bunker Hill, near the Randolph House. The lead was found to be very rich, $81 being taken out in one pan of dirt. As a matter of course, this news spread around the town, and people became excited. Adjoining ground was immediately located. This lead is an old river bed, and is supposed to be same as the Alta Co. worked.

Penn Mine.—18th: Wednesday a contract was let to sink 100 feet of the ledge. The company have concluded to get below all surface disturbances before they take out rock for crushing.

Eureka.—20th: The mill was yesterday cleaned up. The result was about the same old thing—$2,000 per day, not counting the sulphurets. The run of six days gave a trifle over $12,000. The batteries are cleaned up only occasionally.

Spring Hill.—Machinery is to be put on the ledge without delay.

McClellan.—The crushing of 48 tons of rock gave $11 to the ton. The rock now coming out is estimated at from $15 to $20.

Bowery.—The company are about putting up steam hoisting machinery upon their ledge, on Squirrel creek, preparatory to developing. The mine has so far proved rich, the quartz averaging $75 to the ton.

Red Jacket.—Samples of the blue cement and gravel indicate that the Sucker Flat and Smartsville lead exists in the Red Jacket Hill, and the work done demonstrates that the deposit is very large.

Mutual.—*National*, 15th: This morning we saw a lump of gold, which was brought down from Eureka yesterday, valued at $2,500, the result of two or three day's run of the 5-stamp mill of the Mutual Co.

The same of 18th has a long article giving a history of the rich gravel claims just opened by Webster & Co. at Bunker Hill, and confirming the reports. W. & Co. own 1,200 feet front to the center of the hill.

Items.—Same of 18th: Webster & Co. prospected another pan of dirt this morning. A specimen of gold weighing four ounces, was taken out....The Orleans Co. on Gold Flat, struck a ledge two feet thick yesterday. The specimens we saw are very rich, and it is estimated that the rock will pay from $50 to $75 per ton.

Lost Hill.—*Gazette*, 16th: Archibald Nevius is making preparations to open extensive mining claims at the northwest corner of the corporation limits. He will use 2,000 feet of 11-inch iron pipe.

Fair Yield.—18th: A crushing of 40 tons of rock from the McClellan mine, at Stiles' mill, cleaned up Wednesday, yielded $448.

Bunker Hill.—Same of 19th: The excitement over the recent discoveries continues to increase. The gravel struck is six feet thick. On the top of this bed it prospects from 10 to 20 cents to the pan, and at the bottom as high as $50 to the pan.

A Quartz Strike.—*Transcript*, 18th: A rich strike has been made in the Star mine near Washington. This company sometime since made a lease to Lee Garthy & Co., who were to take out rock to be crushed at the mill. These parties struck the ledge, 3½ feet thick, and have taken out about 150 tons of rock. The lowest estimate placed upon it is $25 per ton.

Omega.—19th: We learn from a gentleman who came down yesterday, that the miners have plenty of water and are busy at work. The prospects were never better.

More Bunker Hill.—A dozen companies will soon be at work. The strike has given a great impetus to mining. These rich channels are being better and better understood. With the same evidence of rich mines as Nevada county possesses, the Sandwich Islands would carry off half the people of the State.

Nuggets.—20th: We learn that quite a number of nuggets have been taken out of the claims of Webster & Co. One piece is worth $35, another $17, another $12, one of $7, and numerous smaller ones. Proposals have been made by capitalists to erect machinery on the Grant ground for an interest.

A Grass Valley telegram of 19th says the gravel strike at Randolph Flat is likely to result in many lawsuits. All the ground vacant when the strike occurred, has been located—some of it three or four times over.

PLACER COUNTY.

St. Patrick Ledge.—Auburn *Herald*, Feb. 19th: Joseph McLaughlin sold his claim on the 5th inst. to C. F. Eaton, of Graes Valley, for $3,000, reserving 10 tons of quartz which he had out. Out of these 10 tons he had taken $1,500 in specimen gold; the refuse has since been milled, and yielded $1,544, making $3,044 from 10 tons, or over $300 per ton. If McLaughlin had known that this refuse quartz would mill $150 a ton, it is doubtless whether he would have parted with the claim for twice $3,000.

PLUMAS COUNTY.

Crescent.—*National*, 12th: We are informed that 30 men have made a strike, and refuse to work or let anybody else work in the mine. The cause is the number of hours they are required to work. Mr. Bransford, Supt., is now below, to procure laborers.

SAN DIEGO COUNTY.

Mines.—*Union*, Feb. 10th: About 60 miles from this city, in the vicinity of the San Jacinto mountains, placer deposits have been struck which have prospected from one to fifteen cents to the pan. This section is at present unavailable, owing to the want of water. A gentleman has just returned from a trip up Soledad creek, out by Johnson's ranch, to a point 40 miles from this city. Here, all through the country, and in the vicinity of San Pasqual, the gulches indicate the existence of placers. There is considerable water, and ditching could be easily made available. In quartz, more important discoveries have been made. A party of prospectors have discovered a ledge which is from six to eleven feet wide, and has been traced nearly two miles. The locality has not been made public.

A letter from Sweetwater Valley to the Downieville *Messenger* says that a ledge has recently been opened which capitalists have agreed to prospect, paying all expenses, for one-third of the rock taken out. A test made from the croppings last week in San Diego, resulted in $375 per ton.

SIERRA COUNTY.

Items.—*Messenger*, 19th: Work is progressing on the Good Hope to develop the ledge....Ned Leonard's quartz mill is running on good rock, though the quantity is limited.

Morristown.—Cor. of same: Work has commenced in a small way. Jones & Co. have made a clean-up, paying them five dollaps per day to the hand for all labor done. The American Co. is working 20 men, but water is scarce. They are fortunate, however, in having a large amount of drift dirt.

SISKIYOU COUNTY.

Water Plenty.—Yreka *Union*, 11th: The ditches about Oro Fino and Mugginsville are "swimming full" of water, and every man is at work.

Quartz.—H. T. Sheppard has some good specimens of rock from the Knapp ledge at Oro Fino. The rock is soft and easily crushed, but the gold is not always easy to save. The mill will be running in four weeks.

TRINITY COUNTY.

Corral Diggings.—McCollum, Tinsley & Co. are making preparations to develop the recently-discovered mining district. The mines are high up in the mountains and can't be worked through part of the winter, because of too much snow. The returns are flattering.

McGillivray's.—The suspension flume is working finely. The proprietor says that the pipe will carry 30 sluice heads across the river.

TULARE COUNTY.

Prospecting.—*Times*, 12th: We have been shown some specimens of ore that compare favorably with those from mines hundred of miles away, found within a few miles of Visalia.

Arizona.

Big Bug.—Prescott *Miner*, Feb. 5th: The result of a six days' run of the mill was a bar of gold worth $1,200. The mine was looking first-rate; from 10 to 12 tons of pay ore was being taken out every day, and there were, when Messrs. Gray and Hitchcock left, about 125 tons of ore at the mill.

The Eureka mill at Walker's is idle. So are the Chase and Sterling mills, in Hassayampa district. The Vulture Co's 40-stamp mill, near Wickenburg, is, we believe, paying well.

Mohave County.—Cor. of same: Mr. Otis recently came down from El Dorado cañon with 350 pounds of bullion. The company has been embarrassed all the fall by the difficulty in procuring wood. Capt. John Moss and a large party of prospectors are now out in Clarke, and judging from samples brought here, that is a rich district. Prof. Palmer, of Nevada, says it is the richest silver district he has ever seen. Prominent San Francisco capitalists have become interested, and Moss says they mean work.

Colorado.

Briggs.—Central City *Herald*, Feb. 9th: This mine has produced another monthly retort, weighing 420 ounces, valued at $8,500. During the milling of the ore from which this was produced, there was sold for smelting 40 tons, worth $3,000.

Graes Valley Co.—This company, working the Prize lode, under lease from the Central Co., shipped $500 to New York last week. This lode is turning out fine looking ore, at the rate of five cords per week. The first quality sells to Prof. Hill at $35 per ton.

Quartz Hill Tunnel.—The tunnel has been run 490 feet, and has reached a depth of 275. It has crossed 11 distinct veins, the value of which has not yet been tested. The head of the tunnel has reached a distance of 90 feet from the last vein crossed.

Major Anderson.—Georgetown *Miner*, Feb. 10th: We learn of a contract having been let to sink a shaft 50 feet on this lode This completed, the main shaft will have been sunk 128 feet.

Idaho.

Golden Chariot.—*Avalanche*, 19th: Main shaft 400 feet deep; vein from two to three feet; richer than ever in silver, not so rich in gold. Everything in fine order—shaft well ventilated, and machinery works admirably.

Ida Elmore.—New engine house and appurtenances of the most substantial kind. Greatest depth, 407 feet. Main shaft will go down 20 feet further, and stopeing will then commence. The deeper the shaft, the wider the lode.

Items.—Good pay rock is being taken from the Home Resort. Judge McDaniel and party have leased the mine. Baxter shaft is down 220 feet, and yielding ore scarcely inferior to any. Corduroy is worked by contract. Quite a sensation has been produced by a rich strike just made. Peck & Porter is actively worked. These two mines will doubtless prove rich as the Chariot and Elmore. Mr. Peck is getting the Potosi in shape. Poorman is being worked as usual, also the Empire. The Sands Bro's are prospecting a discovery on the mountain—said to be rich. Crane & Driggs will be re-opened. The Surplus Oro Fino will be worked again soon.

Montana.

Philipsburg—Cor. of Helena *Gazette*, Feb. 10th: The mines are looking better than ever. The shaft on the Speckled Tront is 30 feet deep and rich quartz is coming out. The ledge will assay six feet. Mountain Queen shaft is down 100 feet and a tunnel is being run into the hill from it. Plenty of good rock coming out of Comanche Extension No. 3. The Cole-Sanders Co. have 14 men employed. The mill commenced operations on Saturday, on Mountain Queen ore. The yield is expected to be about $60 per ton.

French Gulch.—Cor. of Deer Lodge *Independent*, 5th: Several men have been rocking in the gulch during the winter, with flattering results, and the prevailing opinion is that the Gulch will employ more men and yield more gold than in 1865. About a mile above town, on First Chance gulch, some twenty-five Mexicans are located, a number having exceedingly rich ground, which extends into a swamp on top of the mountains.

Latest.—A Helena telegram of the 19th says: The mail from Cedar Creek to-day brings a report of still further important gold discoveries in that camp. Stampeders are still on the move.

Nevada.

COPE DISTRICT.

Mountain City.—Cor. of Elko *Independent*, Feb. 19th: The M. C. Co. are taking out very rich ore, to be crushed at the Atchison & Drew mill. The Columbus shaft is down 60 feet; first-class ore coming out. The Argenta is from five to eight feet wide at a depth of 55 feet. The tunnel will tap the ledge 100 feet from the surface. There are 300 or 400 tons of ore on the dumps, worth, on an average, $400 per ton. The Crescent owners are taking out 10 to 15 tons every 24 hours. The ore works $250 per ton.

REESE RIVER.

Silver Bend.—*Reveille*, 16th: It is rumored that the claim of the S. B. Co. has been relocated by Belmont parties. Some $8,000 has been expended upon the mine, and it is an important question whether the local regulations, which regard a claim abandoned if no work has been done upon it for one year, can oust a company under such circumstances.

Same of 18th, says: We learned last evening that the trouble about the Silver Bend Co's mine has been adjusted, the jumpers having withdrawn their claim. It appears that the mine is patented, but the jumpers declared that they were ignorant of the fact. They had taken out several tons of ore, which were sent to mill and reduced. The 10-stamp mill of the Belmont Co. is reducing ore and tailings. The charge for ore is $45 per ton, the mill guaranteeing to return 70 per cent. of the silver. The Highbridge claim of the Belmont Co. (Col. Buel's) is under lease, and has developed a fine body of ore, estimated to yield $500 per ton. The property of the Combination Co. will shortly receive development.

Hot Creek.—*Inland Empire*, 18th: Mr. Perkins, recently from Hot Creek, reports the mines looking well. Four tons of ore from the Reveille mine have been taken to the Zottman mill for reduction. Pulp assays average $500 per ton.

Lander Hill.—*Reveille*, 16th: The hill is lively with "chloridizing" parties, and they make the business pay well.

MINERAL HILL.—A 10-stamp mill is on the way from San Francisco. The *Enterprise* of 20th gets these items from a Mineral Hill correspondent: Smith and Hensley have made a location of black sulphuret and chloride ores, that promise to make them rich. Snyder and Hensley have sent six tons of fine ore to Reno for reduction. Bernard and Maun have shipped three tons from the Chollar lead. The Live Yankee shafts are down 45 feet, at which depth they find plenty of rich ore. The Austin Co. are working their lead by shaft and tunnel, and find fine ore.

BULLION.—*Reveille:* The Manhattan Co. shipped on the 18th, overland, six bars of bullion, valued at $8,342.11. This makes $25,601.94 shipped by that company in three days.

WASHOE.

OPHIR.—*Enterprise*, 20th: Still bailing and pumping. There is 90 feet or more of water in the main shaft.

VIRGINIA CONSOLIDATED.—Drifting will be commenced to-day in rock that can easily be worked with picks. They have their new cage in operation. But little water is coming in.

OCCIDENTAL.—The rock is favorable, and good progress is made. A winze is down 200 feet in the North Occidental, and a "rise" to connect with it is up some 125 feet. Between the winze and rise there remains 190 feet to be excavated, when the two will be connected.

SEGREGATED BELCHER.—This mine is yielding 25 tons of ore per day. They have between 2,000 and 3,000 tons of ore on their dump, which they will begin shipping as soon as the switch from the railroad is completed.

CALEDONIA.—The ore from the upper level has paid expenses so far, and another good streak was found further west last week on the same level.

BELCHER.—This mine is yielding 75 tons of ore per day, mostly from the upper levels. The drift on the 730-foot level is in good-looking quartz.

SUTRO TUNNEL.—Day before yesterday the Sutro Tunnel was in 770 feet in a hard trachyte formation. The water is increasing at the bottom of the tunnel, but as yet none comes overhead.

OVERMAN.—Daily yield 140 tons, all from the upper levels. The winze between the 400 and 500-foot levels is completed.

SACRAMENTO AND MEREDITH.—They expect to have a mill running in two months, and the ore now taken out is piled up ready for reduction.

SIERRA NEVADA.—During the past week this company have taken out 56 tons per day. The mine looks as well as usual, and the mill is kept in constant operation.

HALE & NORCROSS—Is yielding about the usual quantity and quality of ore. The main shaft for the opening of a new level was commenced day before yesterday.

WHITE PINE.

WEEKLY MINING REVIEW.—*Empire*, 20th: Amount of bullion shipped during the week, is $30,388.11. The Aurora Consolidated, Eberhardt and Hidden Treasure are working the usual number of men, and extracting the usual amount of ore.

ITEMS.—In the Blackfoot mine, Blue Hill, on the 19th, the workmen came upon ore equal in richness with the best found on Treasure Hill, showing a great amount of chlorides and horn silver, besides sulphurets. The ledge is eight feet wide.... The Imperial has contracted to furnish the Alsop Co. 1,000 tons of ore at $20 per ton on the dump....Treasure Hill Co. has a shaft 80 feet deep on the Post-Hole; ore improves as they go down....Big Treasure mill runs through daily 54 tons of tailings, besides doing custom work....Aurora South employs 40 men; the mine looks better than ever....On Friday the Nellie Mack struck a body of ore four feet thick which will mill from $50 to $100 per ton. ....Swansea mill will start again this week on Silver Wedge ore....Oswego had a crushing last week which yielded $90 per ton....Consolidated Chloride has been attached for $9,000.....Montgomery has plenty of good ore in sight....Shermantown mills all busy.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Feb. 24, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton.		*Per ton*
12 per cent. ore......	$24 00	18 per cent. ore......	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

San Francisco Mining Stock Market.

Notwithstanding the Grand Festival interruptions of the past week, the transactions at the Board were large, and extended over a considerable range of stocks. However, prices were a shade lower.

With reference to the White Pine District, we extract the following from the *News* of the 21st inst.: "Since the reduction in the price of milling, there is noticeable activity in mines of low grade ores. Work has been resumed upon a number, long idle, and many are being actively worked which were never touched before, save to fulfill the requirements of the law. In consequence of bad roads, some 64 stamps are now idle. The milling capacity of the District aggregates 207 stamps. This large number of stamps has brought about competition, and milling is now down to $12 per ton. The amount of ore in Treasure Hill which can be profitably worked at these figures is inconceivably great, and the result of this reduction is the commencement of work upon a large number of mines which would have remained idle so long as the mills charged $20 per ton for crushing."

CHOLLAR-POTOSI—has been in large request, particularly early in the week, and has maintained very uniform rates. For the week ending February 18th 1,013 tons of ore were extracted, against 1,220 tons the previous week. During the past seven days portions of the Blue Wing stopes have improved. The eighteenth floor of the northwest drift has developed a body of good ore that promises to afford a large amount of ore. It is reported that the 27th floor shows much better ore than the floor immediately under it did, and that the main tunnel west from the Grass Valley section is an excellent ore. The west drift was increased 67 feet, making the total distance from the shaft 190 feet. On the 22d inst. they sent forward bullion to the value of $20,052.

BELCHER—was less active than during the previous week, and sold at a lessened price. Up to the 17th inst. the Rhode Island mill had been supplied with 320 tons of ore. It is said they are taking out about 70 tons of ore per day from the stopes above the 152 level. On the 730 level south of the shaft, they are cleaning out the drift, which had caved by the flow of water, and they intend to continue the drift to the southwest.——CROWN POINT was in the market to a tolerable extent, selling at a considerable recession at the close. During the week closing Feb. 13th, 280½ tons of ore were extracted, showing a 65 per cent. assay value of $3,660 74, equal to $13 05 per ton. The 1,000 level winze has attained a depth of 60 feet.

GOULD AND CURRY—though small sales were effected, exhibits a very fair advance. For the week ending February 21st, 189¾ tons of ore were extracted, against 195 tons the previous week. In the vicinity of the 20th floor of the old mine, (says the Superintendent), eighty feet east of the old timbers, a body of ore has been developed that is much superior to any ore obtained from the mine for years, the assay value of two average samples showing $602 45 per ton. At the point that this body was cut by the drift, the ore measures six feet in width, and will undoubtedly furnish hundreds of tons of ore equal in value to that of the above samples. At the seventh station, the drifts—north and northwest—all have a mixture of clay, porphyry and quartz, and altogether the prospects in that section show an improvement.

HALE & NORCROSS—was moderately dealt in, at a decline from prices obtained the previous week. The ore product for the week ending February 19th was as follows: Upper mine, 175 level, 213 tons; 300 level, 88½ tons; lower mine, sixth station level, 700¼ tons; making a total of 1001¾ tons. On hand, 6,262 tons, of which 2,485 is low grade. They are continuing the shaft to a greater depth, and the bullion yield of the present month will equal that of January.——OVERMAN was not in the market during the past week. During the week ending February 20th, they extracted 818 tons of ore, and shipped 841 tons to the reduction works.——SIERRA NEVADA met with considerable purchasers at a slight decline. The estimated ore product for the week ending February 21st, amounted to 379 tons.——AURORA CONSOLIDATED levied an assessment of $3 per share, on the 23d inst.—*Commercial Herald.*

ORE SAMPLING.—Last week we gave the wrong name to the Wheeler crusher, used at S. W. Howland & Co's crushing and sampling works, No. 413 Mission street. In another issue we shall speak more specially of the matter of selling ores in this market.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the SCIENTIFIC PRESS and other San Francisco journals.]

ASSESSMENTS.

NAME, LOCATION, AMOUNT AND DATE OF ASSESSMENT	DAY DELINQUENT.	DAY OF SALE.
Alameda Coal, Feb. 16, 30c	March 30	April 22*
Alleghany, Sierra co., Dec. 30, 50c	Feb. 7	Feb. 28*
Bullion, Storey co., Feb. 8, $4	Payable immediately

THE MANUFACTURER AND BUILDER.—This excellent publication, devoted to the practical interests of industrial progress, is rapidly and deservedly increasing in circulation. Its pages are filled with the most interesting matter, well chosen and simply written, and the extremely low price ($1.50 per annum) places it within the reach of the poorest. The mechanic will find in it matter to benefit him in his every-day work, and to interest him as to what has been done in his profession, and the more scientific reader will be able to glean much valuable information from its columns. It has much of the value without any of the dryness of an encyclopedia which keeps up with the every-day progress of the age.

* * *

CONRAD WIEGAND delivered an address before the Board of Brokers on Monday last, which was listened to with great interest. The speaker enumerated several *presumptions* which have caused lack of confidence in the management of several mines at Virginia City, pointed out the troubles and suggested the remedies. Mr. Wiegand is evidently intent on reform, in which we wish him all success.

* * *

FLAX CULTIVATION.—We see it stated in an exchange that from four acres of flax, cultivated at Tomales last season, $80 was obtained from the sale of the seed and $400 for the fiber, making $120 per acre, gross receipts.

The Wilson Steam Stamp Mill.

After a mining experience of seventeen years in California, Mr. F. R. Wilson returned to New York, and there, in 1866, worked out the idea of a new stamp mill. The first machine was built in Philadelphia, and gave satisfaction in experimental workings. Feeling, however, that the only way to introduce a new machine was by showing that it could be made useful by *practical* tests, Mr. W. bought the Russell mine in North Carolina, and there ran his mill for seven months. The average amount crushed in this time was at the rate of thirty-five tons per twenty-four hours, while in special instances, when the capacity of the mill was tested, it was run several hours at the rate of three tons per hour. The rock was a tough, blue quartzose shale impregnated with pyrites. These results, which were better than had been expected or claimed, paved the way for the general introduction of the mill.

In our issue of December 11th, 1869, our readers will find an illustration of the mill and details of its construction, the localities where it has been in use, etc. The San Francisco public will have an opportunity in a couple of weeks of seeing one tested at the Pacific Foundry, where three machines,—one for the Overman mine, Virginia City,—are being built.

It is claimed that the Wilson mill will easily accomplish the work of a 20-stamp mill, and can be erected for half the cost. For mines situated in positions where the item of freightage is a large one, the economy in using this mill is still more apparent, as a complete mill weighs only about 5,500 pounds, and, moreover, as one can be set up ready to run in three days. A 15-horse-power engine suffices for this mill, and for fuel about two cords in twenty-four hours. There is one in operation at the Vigilance mine, Nevada, Cal., and the reports which are received here with regard to it are highly satisfactory. In fact, wherever the mills are located, the owners, in letters which can be seen, speak of them in the highest terms of praise. It is stated, moreover, that as a result of the operation of the mill at Nevada, the miners have been so favorably impressed with its economical value, that they have commenced prospecting on ledges which previously have been neglected as too poor to pay under the old system.

New Incorporations.

The following have filed articles of incorporation with the County Clerk, S. F.:

HALEY & O'NEIL TRACT HOMESTEAD ASSOCIATION.—Feb. 11th. Capital stock, $204,000; divided into 400 shares. Directors: E. B. Clement, Wm. L. Duncan, H. G. F. Cofahl, Victor David and J. C. Duncan.

LAKE BIGLER WATER CO.—Feb. 14th. Capital stock, $10,000,000; 20,000 shares of $500 per share. Trustees: James Clark, D. Murphy and W. P. Humphreys.

MAUNTAUCK S. M. CO.—White Pine. Capital stock, $1,600,000; divided into 16,000 shares. Trustees: Washington Ayer, Geo. Hearst, Justus Struver, E. J. Ryan and B. C. Hodge.

The following have been recorded in the Secretary of State's office, Sacramento:

THE SANTA BARBARA WATER CO.—Feb. 15th. Capital, $100,000. Trustees: S. B. Brinkerhoff, Wm. Ord and E. T. Cooper.

SANTA BARBARA GAS CO.—Feb. 15th. Capital, $100,000. Trustees: T. R. Bard, S. B. Brinkerhoff and Chas. Fernald.

SAN FRANCISCO AND NORTHERN COAST RAILROAD CO.—Feb. 16th. Object: to construct a railroad from San Rafael to Healdsburg and Sonoma, with branches to Bloomfield and Tomales. Capital stock, $2,000,000. Directors: David D. Colton, Tyler Curtis, Geo. W. McNear, Geo. A. Worn and Chas. Clayton.

* * *

SCIENTIFIC PRESS.—The title of the Mining and Scientific Press has been changed to the above. It is devoted to mining, farming and mechanic arts, and is a paper worthy of a large support. Terms, $4 per annum.—*Sutter Banner.*

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Diversity in California Climate and Soil.

While the southern coast and much of the interior valley country in this State frequently suffers from drought, so that cattle and sheep perish there from hunger, and crops either fail entirely or come far short of ordinary yields, the coast country along the bay of San Francisco is green with an abundance of rich grasses and of forward grain fields, and the farmer is expectant of full harvests.

Here we have cool, moist breezes beneficial to vegetation, while inland and down the coast the winds are drying and blighting. Here, even in seasons of extreme drought, dews, and sometimes refreshing showers, moisten the earth and refresh the growing vegetation, there a drying air robs night of its dews, and disappointing clouds vanish with fleeting hope.

The differences of climate on this coast, north and south, and in the various sections of the interior valleys, as also along the Sierra foot-hills and among the mountain valleys, is so great, so varied, so strikingly different, as to mislead the calculations of one not thoroughly conversant with each section, and able to comprehend the nature and reason of things. A plowed field along the coast in Alameda county would actually condense water from the air during several months in the year, while a similar field in some of the interior counties would yield up what little moisture it contained to a drying atmosphere. A system of cultivation beneficial to certain plants here, would prove to be a total failure there to the same kinds.

And then the difference in soils also, and seasons, too, is so great, between mountain and low lands, adobe soils, sandy soils, interior meadows, tule lands, salt marsh soils—chemically and mechanically—all in connection with dry and moist, hot and cool winds, sun and shower, that wise indeed must be the one that dares to set himself as teacher for all.

With the accumulated experience of years, men of good sound common sense will assure you that they are frequently at fault—are constantly finding out and adopting better ways of culture suited to their surroundings, and are getting rid of preconceived notions and theories, which have frequently cost them dearly; in short, they are *learning* and *conforming* to the facts.

Farmers will tell you that they have learned *here* all that they know about managing their farms on this coast, and that they know more and better how to do it, than can be told them by other than experienced farmers here. There is much force in such assertions. Facts are what we all want. The results of various methods of culture and treatment on various soils, and under various conditions, are what Californians must depend upon. Facts practical in their application here, facts clearly stated, easily comprehended, are what we all need. Let theories whistle for the dogs. Give us facts. And it is to you, practical farmers, that we, as the conductors of this journal, look for such information. Bring facts, and let us "reason together."

Sherman and Twitchell Islands.—The owners of these islands have given leases of about one-half the same, in small areas, to farmers, who are now busy in preparing the land for planting. The lands will be chiefly sown with wheat and other grain. Perkins, the seed man, is putting in a large area of sugar beets for seed, counting on a large demand for the same for parties who will next year engage in beet culture, for the new sugaries, the erection of which has been more or less definitely determined upon.

Agricultural Improvements—The Tule Lands.

California is a country peculiar to itself; whether in the mine or upon the farm, old processes and old machinery require, for their adaptation here, numerous modifications to suit them to the local work required of them. The improvements and modifications in mining machinery which have been brought out in California, are almost innumerable. Inventors of agricultural implements have been equally busy in devising new machines and modifying old ones. The Standish plow may be referred to as one of the most important and promising of the latter. The same may be said of the Locher and several other plows.

In the process of reclaiming the tule lands, it is found that a new plow is needed. The soil of these lands is a light black alluvium, with a spongy surface, mostly made up of fine peaty roots. The ordinary plow is entirely useless for such a soil, until it becomes pretty thoroughly rotted, after the lapse of a series of years. Some attempts have been made to cultivate it immediately after reclamation, by burning over the dry surface in summer, and sowing or planting in the ashes, as soon as the ground is moistened with the first rains of winter. But burning the surface has numerous objections.

A new machine is being devised to prepare this soil for cultivation, which will be hauled over the soft, spongy surface by one of Thompson's celebrated road locomotives, which works upon very broad wheels, with india-rubber tires. Mr. Robert Watt, the well-known mining engineer of Grass Valley, while on a recent visit to Scotland, carefully examined this locomotive, and pronounced it practical for the purpose intended, and one of the locomotives is now on its way here, having been ordered by Mr. George D. Roberts, a gentleman largely interested in tule land reclamation.

The machinery which will be employed to break up the land is a combination of powerful cutters. The first of these will consist of a simple axle, studded with knives, which rotate upon the axle, and cut up the spongy mass into shreds. This will be followed by another set of knives, working on the principle of the Standish plow, which will rotate horizontally and with a forward movement. The effect of this double action will be to cut and break up this tangled mass of vegetable fiber into a finely comminuted soil, admirably fitted for the production of crops. When so prepared, the tule lands will constitute the most valuable agricultural soil in the State.

Why Cows should be Carded.—There is perhaps but little need for carding cows which run all the time in the field, for the reason that they card themselves—employing their tongues, hoofs, fences, trees, etc., for that purpose; but when a cow is kept tied in a stable, or in close yards, as city dairy cows often are much of the time, carding is indispensable. The same is true of fattening animals. Horses are always curried and carded. Carding is a luxury to any animal, if gently performed; and besides being a merciful thing, it is economical also. It increases the flow of milk by aiding digestion, and keeping up a loose, lively and healthy skin. It makes beef for the same reason. It is economical, because, by aiding digestion, it obtains the maximum of benefit from the food eaten, and, therefore, saves food. Carding is to the animal what bathing is to man, and should never be omitted, especially when the animal is kept in anything like close confinement.

One would think that a kind-hearted man, when he sees how grateful this operation is to a cow, would be willing to spend a few moments, at least two or three times a week, in carding her. It is no stupid idea of a fancy farmer, for it pays, and there's money in it.

Butter from Whey—Economy in Cheese Manufacture.

However much the cheese-maker may desire to fix in his cheese all the butter in the milk, its complete retention is impossible by any known method—much of the butter will run off with the whey. This butter usually goes to the hogs—excellent food for them, but a wasteful policy for the proprietor.

Does any cheese-maker dispute the possibility of making butter from whey? If so, we can assure him that he has a pleasant and profitable lesson to learn; at least, such is the abundant evidence recently placed on record, by practical men. The precise *modus operandi*, however, we are not able to give, although we would cheerfully undertake to secure it, should any of our California cheese-makers especially desire such information. The process is said to be very delicate; yet those who have had experience in the matter hold that, especially in connection with large cheese manufactories, it leads to a very great economy.

Mr. Kenney, of Cortland county, N. Y., in 1868, made 288,000 pounds of cheese, from the whey of which he saved 9,000 pounds of butter—equivalent to a gain of 18,000 pounds of cheese. His cheese brought the highest market price, and his average was full as large as though no butter had been made from the whey, and the whey thus treated lost no appreciable value as food for swine.

The flavor and richness of cheese depends but very little on the amount of butter which it contains; but almost exclusively on the healthiness of the milk and rennet employed in its manufacture, the cleanliness and skill of the manipulating processes, and the nice admixture of moisture among the particles. An analysis of the best English cheese shows less butter, but more moisture, than a corresponding quality of American cheese. The difference in moisture alone is set down at seven per cent. The English manufacture an equally good or better article than we do, with less butter (a costly ingredient) and more water (an ingredient which costs nothing).

The fact that the quality of cheese is not largely dependent on the butter it contains, is leading to the practice of skimming the night's milk and mixing the skimmed milk with the unskimmed morning's milk, and depending on care and skill rather than butter for quality. The yield of cheese to the pound of milk is somewhat less; but the greater value of the butter leads to an important saving. It is claimed that, as a nation, we are now sacrificing millions annually in our cheese manufactories, for which we get no equivalent.

The Original Potato—Going Back to Avoid Disease.—It was a favored theory with many two or three years since, that the potato disease was due to the degeneration of the plant, and that if growers would go back to the original wild plant, obtained direct from Peru, healthy varieties would be produced. To test this theory, several prominent growers of this esculent have obtained both seed and tubers from this original source; but the results of the enterprise have not been satisfactory, and the theory is now, we believe, well nigh abandoned.

A flock of blackbirds, winging its way southward, estimated to have presented a column in line of at least four miles, and about 20 feet in depth, passed over Sacramento on the afternoon of Wednesday of last week.

Butter Test.—Good butter should cleave from the knife, and show particles of moisture, like dew. It is better that it should not "come" in less than twenty minutes.

What I Know of Farming—No. 6.

Mr. Greeley devotes No. 6 of his series under the above head to "Laying off a Farm and Pasturing," from which we condense as follows: The first thing to be attended to by a person taking possession of a farm is to study well its character, determine its capacities, make himself acquainted with its peculiarities of soil, etc. One year should be devoted to this study.

This is as important on the Western prairies as amid the rugged scenery of New England, for the prairie is by no means an unbroken meadow, but is more or less diversified by water courses, "sloughs," elevated "swales," timber, brush, etc. While a young man, just starting on a farm, must devote at least an average of five days out of the week to the growing or earning of present bread, yet he should none the less carefully study the capacity and adaptability of each acre of his farm, and gradually mature a comprehensive plan for ultimately bringing the whole to its best and most useful condition.

Mr. Greeley dwells at considerable length on the selection and location of a pasture, which is so essential to Eastern farms. This, instead of being in an out of the way place, should, on the contrary, be located as near the center of the farm as possible, so as to be convenient to barn. Natural shade, shelter, and water for stock, should be secured, if possible—if they do not exist naturally, they should be artificially provided. A small pasture, well cared for, is better than a larger one poor in quality and illy provided.

The young farmer should always bear in mind the impossibility of obtaining something out of nothing. Some endeavor to get something for nothing, by allowing their cattle to browse over the hills, or upon their neighbors' fields, in quest of needful food. Against this Mr. G. most vehemently protests. Under the unnatural conditions which environ the squatter upon the lone prairies, something is sometimes gained in this way for a while; but this condition of things is transitory, and at war with the exigencies of civilization. The universe was framed on a plan which requires so much for so much; and this law will not, as a rule, submit to defiance or evasion.

A good farmer will run a mowing machine over his pasture twice each summer, to cut down the weeds in blossom, and prevent their going to seed and multiplying. If, in consequence of the topography of the land, or for other reasons, the use of the machine is not practicable, the scythe should do the work. Cutting off and killing noxious plants in blossom, will benefit the soil, which their growth uselessly taxes. Mr. Greeley dwells with much force upon the necessity of shelter for stock from both sun and storm. Even the climate of Texas requires sheds where cattle may keep dry and warm in long, cold rains.

California farmers would do well to consider this advice. Few appear to realize how much cattle shrink and suffer from such a pelting rain as we have had throughout the past week. The man who is merciful to his beast in this respect, will find the same a good paying investment, as well as a humanizing act.

Corn and Wheat.—The corn crop throughout the Union for 1868 was more than four times as great as that of wheat. The former aggregated 905,000,000 bushels, while the latter reached only 224,000,000. Illinois was the largest producer of both wheat and corn, that State having reported 138,363,000 bushels of corn, and 28,560,000 bushels of wheat. The product of California for that year was 20,000,000 bushels of wheat, and 1,220,000 of corn. Illinois and Wisconsin are the only two States that exceeded California in the yield of wheat.

Cheaper than Chinamen.—We understand that Mr. Geo. D. Roberts has contracted with the inventor of a new ditching machine, now being constructed, for the reclamation of some 30,000 acres of tule land. The contract price of ditching and embanking is ten cents per cubic yard, some forty per cent. less than the cost of Chinese labor for the same work.

Plants Suited to the Arid Plains of Southern California.

There is a region in the interior of Southern Africa subject to almost continual summer drouths, that corresponds in a remarkable degree to the arid plains and valleys in the southern part of California. Nature, however, has been more lavish in providing the former locality with plants suited to its climate than she has with the latter. Thus creepers there abound which, having their roots buried far beneath the soil, feel but little the effects of the scorching sun. The number of these plants which have tuberous roots is very great; and many of them exhibit a structure evidently intended to supply nutriment and moisture to man and animals, when, during the long droughts, it could be found nowhere else. Several of these plants are described in a late English publication, by Dr. G. Hartwig, entitled "The Tropical World," from which we extract as follows:

One of these blessings to the inhabitants of the desert is a small plant named *Leroshua*, with linear leaves, and a stalk not thicker than a crow's quill; but on digging down a foot or eighteen inches beneath, the root enlarges to a tuber, often as big as the head of a young child, which, on the rind being removed, is found to be a mass of cellular tissue, filled with fluid much like that in a young turnip. Owing to the depth beneath the surface at which it is found, it is generally deliciously cool and refreshing.

Another kind, named *mokuri*, is seen in other parts of the country, where long-continued heat parches the soil. This plant is an herbaceous creeper, and deposits under ground a number of tubers, some as large as a man's head, often in a circle, a yard or more horizontally from the stem. The natives strike the ground on the circumference of the circle with stones, till, by hearing a difference of sound, they know the water-bearing tuber to be beneath. They then dig down a foot or so and find it.

But the most wonderful plant of the desert is the Kengwe, or Këme *(Cucumis Caffer)*, the watermelon of the Caffres. In years when more than the usual quantity of rain falls, vast tracts of the country are literally covered with these juicy gourds, and then animals of every sort and name, including man, rejoice in the rich supply. Crossing the desert, Mr. J. Macehe found them in such profusion that his cattle lived on the fluid contained in them for not less than *twenty-one days;* and when at last they reached a supply of water, they did not seem to care much about it.

On the west coast, along the banks of the dry bed of the Kiusep, Anderson found almost every little sand-hillock covered with a creeper, which produced a kind of prickly gourd of the most delicious flavor. The *naras*, as it is called by the natives, is about the size of an ordinary turnip, and, when ripe, has a greenish exterior, with a tinge of lemon; while the interior, which is of a deep orange color, presents a most cooling and inviting appearance, and for three or four months in the year constitutes the chief food of both man and beast.

The *naras* contains a great number of seeds, not unlike a peeled almond in appearance and taste, which, being easily separated from the fleshy parts, are carefully collected, dried in the sun, and then stored away in little skin bags. When the fruit fails, the natives have recourse to these seeds, which are equally nutritious, and perhaps even more wholesome.

Thus even in the desert the bounty of the Almighty provides sustenance for men and all His creatures. Would it not be well for some of the enterprising ranch-owners of Southern California to take measures to procure some of the seeds of these useful plants for growth upon our own arid plains? We presume the seeds might readily be obtained through the Agricultural Department at Washington, if the attention of Commissioner Capron was called to the importance of such a project. There is no doubt but that they might be easily cultivated, and spread by natural growth throughout all the lower valleys and plains of this State, Arizona and Lower California. Many useful foreign plants have recently been introduced into this country; but we are not aware that any attempts have yet been made to acclimate here any of those above referred to. The propagation of all that is useful or beautiful in nature from other countries to this, so far as this portion of the world is adapted to their growth, is now being made a special work by our National Agricultural Department, and by many of the prominent agriculturists throughout the country.

How to Test the Richness of Milk.

It is of no little importance to have at hand a convenient and reliable mode for testing the richness of milk. This is usually done by the mere rule of "guess." We will give a more reliable way, within the reach of all, and one whereby any person may safely govern himself in deciding upon which of any number of milkmen he will patronize, or of which of any number of cows he will purchase.

Procure any long glass vessel—a cologne bottle or a long phial. Take a narrow strip of paper, just the length from the neck to the bottom of the phial, and mark it off with one hundred lines at equal distances; or, if more convenient, and to obtain greater exactness, into fifty lines, and count each as *two*—and paste it upon the phial, so as to divide its length into a hundred equal parts. Fill it, to the highest mark, with milk fresh from the cow, and allow it to stand in a perpendicular position twenty-four hours. The number of spaces occupied by the cream will give you its exact percentage in the milk, *without any guess-work.*

Now, if you wish to carry the experiment further, and ascertain the percentage of butter in your cream, set the milk in a large dish, and collect, say 100 or 200 ounces of cream; make your butter, and you will know the percentage of butter in the cream by ascertaining the number of ounces of butter you have made from it. Thus, if one hundred ounces of milk give ten ounces of cream, and ten ounces of cream give five ounces of butter, you will know that one hundred ounces of milk will give five ounces of butter.

Such experiments are worth being made, and made carefully. In no other way can you know what you have in a cow or milk, or what you are buying. In this way also you may test the exact nutritive value of different kinds of milk from your cows—a very important matter. Farmers may derive much benefit by making a few simple experiments, now and then. They need not interfere with any of the regular duties of the farm; and nothing but a spirit of habitual indolence of thought and action will keep them from doing so. Such experiments often lead to important results, and evoke interesting and instructive facts.

Paper Packages for Preserving Butter and Lard.—Experience and common observation show that butter and lard deteriorate mainly from contact with the atmosphere. Butter, in sealed packages of tin, has been sent from Ireland to China and kept good for two years. Air-tight packages cannot be made of wood, unless especially prepared at considerable expense. It has recently been proposed to make packages for butter and lard of *papier mache*, which is perfectly air-tight and impervious even to kerosene. Kerosene cans have already been made of this material.

The Next Wheat Crop.—Returns to the Department of Agriculture during the month of January indicate a decrease in the breadth of wheat sown in Indiana, Illinois, Michigan, New York, New England and the cotton States. Kansas, Arkansas, West Virginia and California have increased their average. The decrease in the breadth sown throughout the entire Union has, no doubt, been very large. This result has been brought about by the low price which has ruled in the wheat market the past season.

Farming and Gardening in Alameda.

Of all the many sections of country that I have visited in this State and adjoining Territories, for varied culture, a rich and easily worked soil, a certainty of good harvests, a ready market, a temperate and even climate, and the advantages of civilization, I know of no place more desirable for a home than this valley along the Bay of San Francisco.

Every sort of fruit with the exception of the grape—which requires a hot dry climate—will grow almost to perfection. The grain and hay crops, with proper culture, cannot be excelled. All vegetables yield prodigiously. While much of the State is suffering from drouth, I am assured by farmers in the hills along the bay that good cows are averaging a yield of sixty-five pounds of butter per month on grass alone. For the dairy business, this section of country, close to the best market in the world, is unrivaled. With a proper cultivation of hay and grain, vegetables and green feed, a small quantity of land would suffice to support many cows. Yet I see few dairies, and very little system among that few.

Why will farmers persist in sowing grain, year after year, on the same ground, till the soil is impoverished, and weeds possess the land, filling the grain with filth that makes it unfit for market, when the expense of such culture nearly equals or exceeds the profits? Yet many do so, when by plowing under a green crop with the stubble, and summer fallowing thoroughly through the dry season, they could kill out the weeds, enrich the soil, and raise good clean grain and hay. Then by cultivating vegetables, etc., and converting their produce into horses, cattle, butter, pork, chickens, etc., the farms would improve, and their owners grow rich with prosperity. When farmers complain of losing money, and of bad luck, I always find a reason in poor management. There is no theory about this; but an incontrovertable fact. Why not see it and profit by it?

Fruit Culture.

A careless system of fruit culture has resulted in poor fruit that has rotted on the ground in many cases, and discouraged some owners of orchards. Although apples and pears are low in the market, yet such orchards as were properly trained and cultivated have yielded fair returns. Instead of cutting down the trees, as some are doing, more attention should be given to thorough cultivation. Good fruit may either find a market or be utilized in some other way. In the Eastern States nothing of the kind is wasted, and why such unthrift here? It is better to feed fruit to stock than to let it decay.

Cherries

Have paid better here than any other tree-fruit for some years. Everybody has found it out, and everybody is going into cherries, expecting to get rich at it. So we may look for cherries to be plenty in a few years more. Like the strawberry, this kind of fruit is of little account out of its season; and if once overdone will result in loss to all.

Gooseberries and Currants.

There appears to be no end to gooseberries and currant plants put out this season. The fine yield and good prices of these fruits have excited everybody. But as these fruits are valuable the year round, prepared for use in cans etc., the demand will grow with, and meet the supply. The hot interior valleys cannot succeed in producing these fruits, but must be dependent upon the mountains and the coast for currants and gooseberries. Many

Blackberries and Raspberries

Are also being planted. These are valuable fruits, and can be utilized in many ways. Indeed, too little attention has been given heretofore to the culture of these small fruits.

Strawberries.

Very few are planting strawberries. The rush to get rich raising strawberries received its death-blow last season, and is finished. Said "rush" is now planting cherries for the coming generation. Probably the man that continues to stick to his legitimate strawberry bed will prosper.

Nut Trees.

Many almond trees are also being planted. This is a good thing. Though not as prolific of fruit here as in some other localities, yet they yield fair and grow vigorously. After the few years' growth necessary to the maturity of the tree, they promise much. More attention should be given to the cultivation of all sorts of nut trees. The reason that more have not been planted, appears to be the time it requires to bring them into bearing. But taking into account the increase of value resulting from each year's growth of a nut tree grove, it will pay as a speculation merely—to sell again.

The High Prices of Land

In this vicinity appear to deter all but capitalists from purchasing farms, and capitalists buy more for speculative purposes than for permanent improvements. They design to lay out streets, set out a few street shade trees perhaps, and they anticipate realizing four times in selling house lots. Some of them do make money. But this thing is run to extremes like many others in California, and taxes, you know, must be paid. The land is much of it rented, and at pretty high figures, to tillers of the soil. Of course the man that cultivates such land tries to get all he can from it, with as little expense as possible, and cares little what condition the soil is left in. This engenders a habit of unthrift and negligence that is reprehensible in a settled farmer, and accounts for much poor management.

The principal improvement that a capitalist thinks of making is, to plant a park of magnificent design and expense, and erect a grand palatial residence, a little better than anything around. He then either fails, or marries some rich heiress, or goes "East," and leaves some agent to manage things, while he fails to come back, goes crazy, commits suicide or something equally romantic.

What looks more cheerless than a grand mansion standing alone and unoccupied—a cold mockery to extravagence and pride? And what more pleasant than a frugal farmhouse with its well tilled acres and its clustering barns, its trees and fruits and flowers, its varied plenty from a generous soil? The animals that know the tender care and kindness of its occupants, meet with mild eye the intelligent glance of an independent man. Happiness fills such busy homes, and children laugh with very joy; books there are relished for their worth.

If the capital that is put to idle speculation to support luxury, or gratify the ambition of miserable pride, was economically employed in encouraging permanent industry, it would never fail to reap reward, and help the progress of the world. H.

The influence of the agricultural press has increased ten fold in twenty years.

San Francisco:

Saturday Morning, Feb. 26, 1870.

The Rain of the last few days has reached every portion of the State, and fully removed the last lingering fear of "short crops." A fair average of the usual showers of March and April, which never fail, is all that can now be asked for. Considering the increased breadth of land which has been sown the present year, we may now look with the utmost confidence for fully as large a surplus of grain for next year's shipment, as has come forward at any time in the past.

There is an evident improvement in business generally. The commercial derangements growing out of the opening of the Pacific Railroad are fast being settled, and the gloom of the past few months has nearly passed away. The farmer, the mechanic, and the merchant all now wear a cheerful look, and feel confident of a prosperous future.

The mining interests are also looking up again. Our leading mines are doing well, and new and important discoveries are constantly being announced. The hydraulic mines were never more prosperous or more extensive than now. The rivers and ditches are full of water, and the usual supply of dust from the rivers, gulches and placers is beginning to come in. This is good news to all, and should confirm, more than ever, our faith in our resources and enterprise.

* * *

The Freiberg Process.—In connection with the concluding remarks on this subject in a communication on another page, a few figures may be given to enable our readers to compare the circumstances (and, therefore, the relative values of any process) of Germany with our own. The total amount of ore treated in the processes described, is about fifty tons daily. For working this amount in the ways described (but not with the Rittinger table) 32 men are employed, whose wages amount to about $6¾ (coin) per diem. The cost per ton of raw ore is about 30½ cents. About 1,260 tons of slimes are yearly produced, which contain 1,121 pounds silver and 631 3-20 tons lead, valued at $42,099. The scale of prices for ore bought at the smelting works is arranged in such a way that it is for the advantage of the mills to dress the ores to as high a degree as is possible. Our crowded columns prevent our giving more than the bare details.

* * *

The Potter Fire Arm.—Mr. A. F. Potter, of Oakland, the inventor and patentee, of the new projectile, which secures the advantages of the rifled gun when employing a "smooth bore," has gone to Washington to make an exhibition of its advantages at the National Capital.

* * *

A Brief report of the Commissioner of Patents for 1869 is received. It is a good document, and we shall publish it in future numbers of the Press.

* * *

Hooker's new force and lift pump will be illustrated next week.

Our City Foundries.

There seems to be a better feeling in general among the foundrymen with regard to the prospects, and there are indications of livelier times. Some foundries are employing a rather larger number of men, and with the spring it is hoped that there will be a greater demand for work.

At the Pacific Iron Works, three of Wilson's steam stamp mills are to be built, and one is in course of construction for the Overman mine, Virginia City. At these works there is also a fine working model of the Chambers' brick-making machine, which is in extensive use at the East. This machine takes the clay as it comes from the bank and forms it into bricks at the rate, it is said, of fifty to eighty per minute. In connection with this machine it is proposed to use the Adams' steam kiln, a diagram of which will be shown at the works.

At the Ætna Works, a large lot of castings for columns, etc., is being made for the Jewish Synagogue, to be erected on Taylor street. An extensive order has been received for work for the Roman Catholic Orphan Asylum, which is to be built at Bay View, as the building on Market street is to be sold. The work on the machinery for the Jo. Walker mine is nearly completed.

At the Risdon Iron Works, the castings were made for the Wickersham street sweeper, which has just been built for Mr. A. Weed, and of which we made mention in our last issue. Other work is being done, and several large orders are coming in.

At the Vulcan Works, a locomotive for the San Quentin and San Rafael Railroad is undergoing a thorough overhauling. Stewart & Lloyd's patent anchors, weighing 1,600 to 1,800 pounds, are being cast. A boiler for mining machinery and one for a sawmill are being made; also a large one for the steamer Rabbona. The shell of this is 90 inches in diameter and 12½ feet long behind the fire-box. There are 10 direct flues (of 11 and 13 inches diameter) and 46 return tubes, five inches in diameter. The weight, when completed, will be about 16 tons, and the material is the best ⅜-inch No. 1 charcoal hammered American iron. There are two furnaces. The boiler will bear with safety a pressure of 175 pounds. The gold rolls of the San Francisco Refining Works are being repaired. The Hepburn pans are working ore from the Pioche ledge, Meadow Valley. This ore is quite peculiar, and is said to contain sulphide and chloride of silver, carbonate of lead and oxide of iron as predominating minerals. About 5½ tons have been worked, of an average value of about $680, the average yield in the pans being about 80 per cent. of the fire-assay.

* * *

Cheaper than at the East.—Messrs. Savago & Co., of the Empire Iron Foundry, 294 Howard street, in this city, inform us they are making all kinds of castings, as low as they can be turned out at the East. The attention of contractors and marble workers is called particularly to their grates and fenders, which are said to be furnished much below New York prices. For the different kinds of work done, reference may be made to advertising columns.

* * *

The Accident at the Pavilion, whereby the rammer had his right hand shattered, and a boy was struck in the abdomen by the ramrod, is said to be due to the carelessness of the rammer in not sponging out the gun properly. The boy will recover, it is thought. The explosion was not caused by the electrician of the festival, as the wires were not attached at the time to the gun.

* * *

One Thousand extra copies of the Scientific Press are published this week, and may be had of news agents in the city or county at ten cents per copy.

[*Continued from page* 129.]

The guns, which accompany the chorus in the Star Spangled Banner and the Anvil Chorus, are fired by Mr. C. E. Valentine, of the Western Union Telegraph Co. The electrical machine is placed in the building near the organ. The guns, six in number, were furnished by the California Guard (Bluxome's Battery).

The Mechanics' Pavilion,

Where the festival is held, stands on Union Square. The main building is 277x180 feet. It is built very strongly and will easily bear all the weight which it is required to sustain. At the east end are the raised seats for the chorus; in front of these is the stage for the orchestra. The decorations, under the charge of M. Denechaud, are very tastefully arranged. The front of the galleries are decked with hangings of various colors, and with wreaths of flowers, and between each panel is placed a medallion with some musical or classical emblem or the name of some famous musician or man of science or art. At the western end is the grand box, named "Washington," festooned with lace and with the American and French flags. From the roof depend streamers and garlands. Wreaths and flowers and various other decorations abound, and the whole effect is exceedingly fine. The liberal action of the Mechanics' Institute in kindly offering the use of the building was most kind and praiseworthy. It may be remarked that the box (with seats for seventy persons) was sold for $3,200; and that the highest price paid for seats was by Mr. R. B. Woodward, who gave $120 apiece for five seats. Mr. R. B. Swain gave $100 apiece for three seats.

Camilla Urso,

The queen of the festival, whose spirit pervades every department, and has rendered success certain, was born in the city of Nantes, France. Her father was an organist of considerable celebrity. At the age of seven years she appeared at a public concert, where she received a perfect ovation. Soon after she entered the Conservatory of Music at Paris, where she studied for three years under the best of masters. She then visited the United States in 1852, and created a *furore* everywhere she went. She remained in seclusion for five years after her American tour, and when she returned to public life her success was even more decided. She visited France, giving concerts during a space of fourteen months, and then returned to the United States, where she has since remained.

The Mercantile Library

was established in 1863, and began life with a collection of 2,500 volumes. It has hitherto been supported by subscriptions of members, without having received a single gift or bequest from outside quarters. It has grown and prospered however, until it collected some 28,000 volumes, besides several historical paintings and portraits, marble busts, and a cabinet of minerals. In 1867, at a period of great business activity, the association, feeling the need of more convenient quarters, and encouraged by promises of assistance, resolved to erect its own building, and a lot on Bush street was purchased, and the handsome building erected on it. But the cost was much larger than was expected, and amounted—for building and lot—to $236,000. The remarkable depression in business occurred, and the donations promised were not given. For these and other reasons, the Library has suffered, and finds itself deeply in debt. We hope, however, that the exertions of Madame Urso will stimulate our citizens to lend further assistance and save what is, or ought to be, the pride of the city. The officers of the Association for the year are: President, R. B. Swain; Vice-President, W. H. L. Barnes; Corresponding Secretary, D. Wilder; Recording Secretary, T. R. Hayes; Treasurer, W. C. Ralston; Trustees, W. G. Badger, Isaac Wormser, Dr. J. M. McNulty, Samuel Hubbard, Wm. Ashburner, A. M. Ebberts, F. B. Reynolds, A. P. Elfelt. Libarian, A. S. Stebbins.

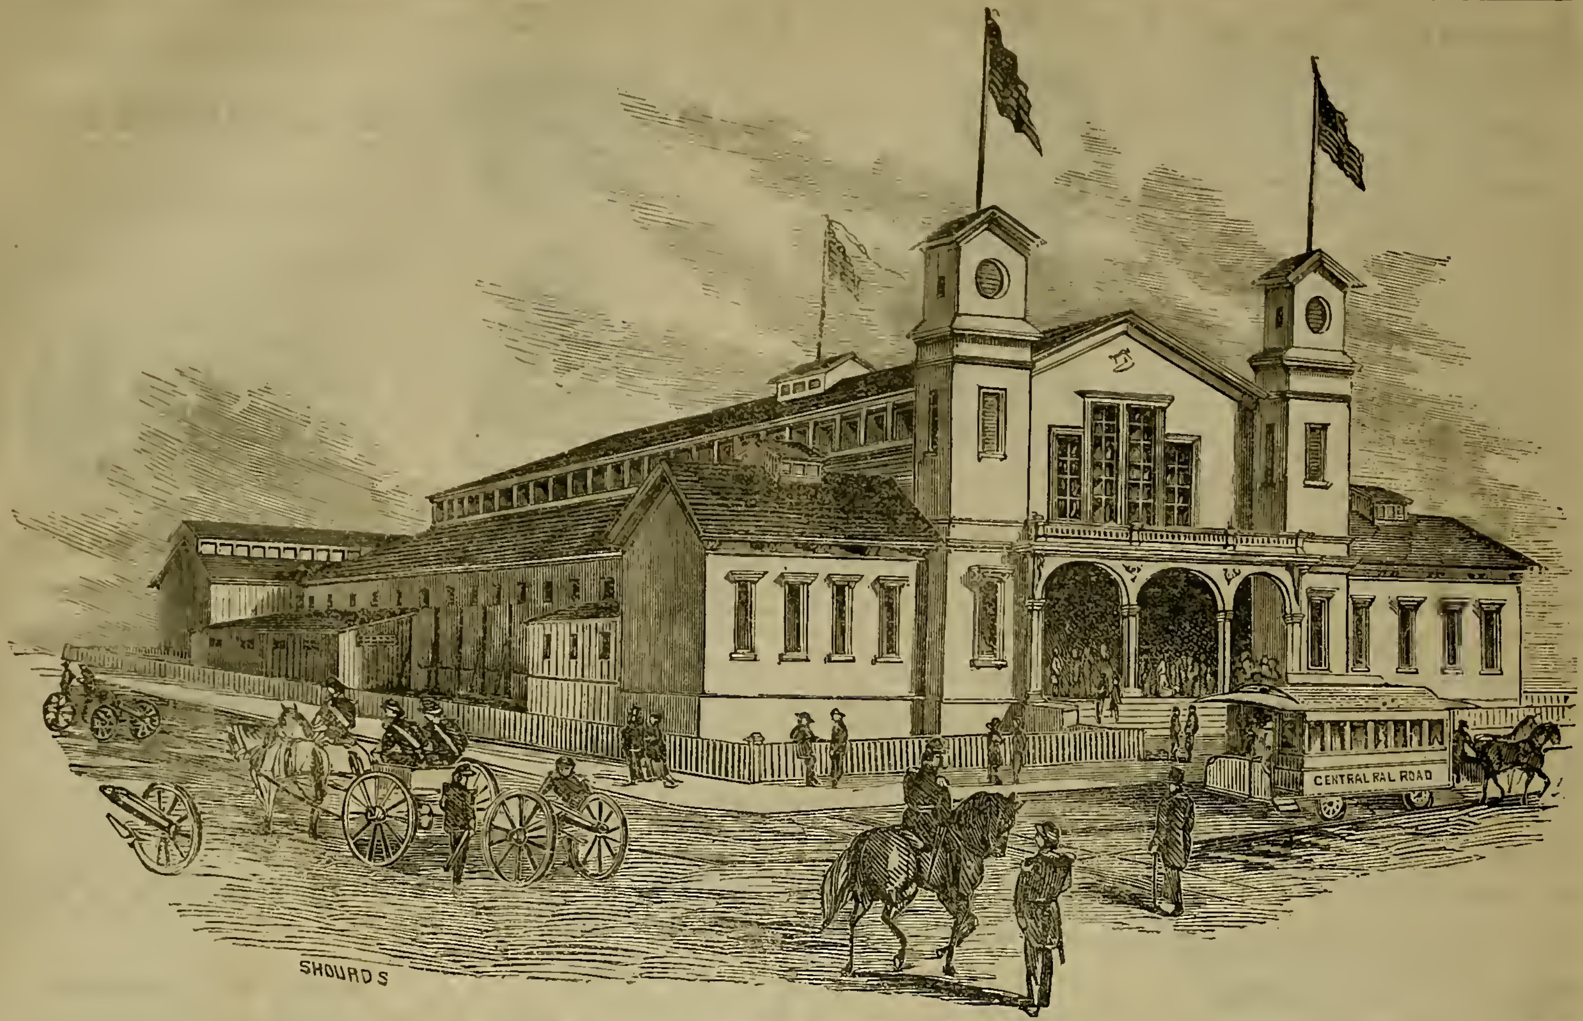
MADAME CAMILLA URSO.

The Concerts.

The sight on entering the Pavilion was most inspiring. The decorations were so exceedingly tasteful that the interior had been transformed into quite a fairy palace. The effect of the dresses of the ladies of the chorus was that of a grand flower garden, and the blending and intermixing of the bright colors was most beautiful, backed as it was by the dark fringe of sober-clad male singers; and, as during a chorus, the leaves of the singing books were simultaneously opened, it was as if a breeze had for a moment upturned a thousand white petals. By no means unimpressive is the grand gathering of the audience below and in the galleries, filling every seat, and every available standing place.

The First Day.

The 22d of February had been very appropriately chosen for the initial concert, and the pieces all had a national character. Promptly at the appointed time, at the wave of the conductor's baton, the grand military band commenced Weber's Jubilee Overture, and with this appropriate piece, the festival was commenced. The overture was followed by Zoelners Prayer of the Earth rendered with fine effect, by the German societies of California. Then after the lady singers, who had hitherto remained outside, had taken their seats, the orchestra commenced Conradis *pot pourri*—a Tour round the World. As the piece progressed, and national hymn after hymn rolled forth, the audience became more and more excited, and when the chorus rose, and the voices poured forth the grand harmony of "America," amid the crash of the band,



GRAND MUSICAL FESTIVAL BUILDING—MECHANICS' INSTITUTE PAVILION.

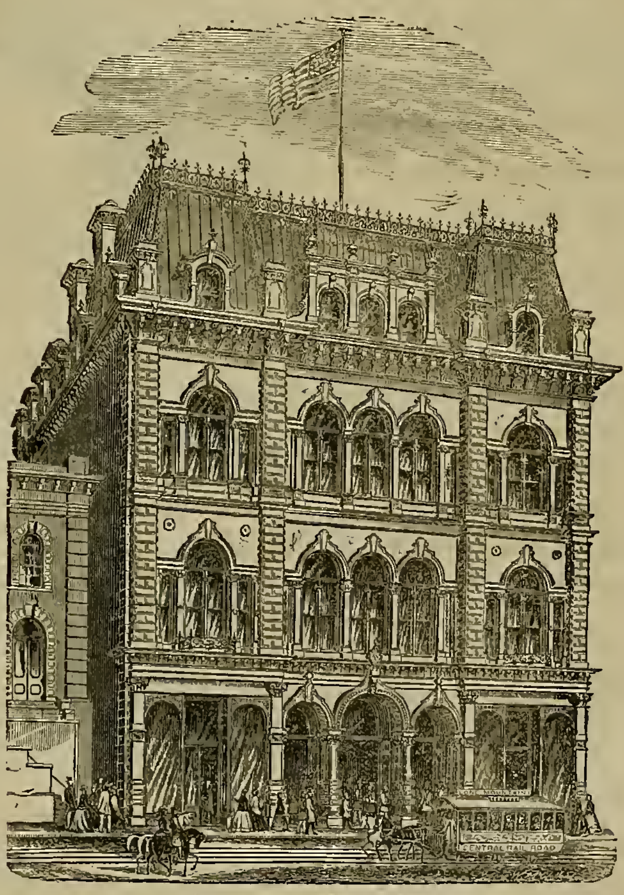
the rolling of the drums, and the deep base of the cannon, an electric thrill passed through the audience, and the enthusiasm knew no bounds. The effect was supremely grand, and the power of music, aided by the concomitant of patriotism, never more fully vindicated. As the piece ended, one prolonged burst of applause followed, the audience waved their handkerchiefs and hats, screamed, pounded with umbrellas and canes and feet, and would not be quieted until the piece was repeated with the same grand effects. "Night shades no Longer" (from Moses in Egypt) followed, and was enthusiastically encored.

Part second commenced with the overture to Fra Diavolo, rendered by the military band. Then came the quieter, rich full music of the Hunters' Chorus, from Euryanthe, sung well by the German Societies, notwithstanding the discordance of the accompaniment. The rendering of the Anvil Chorus by the twelve hundred voices, the full orchestra and band, the ringing tones of the anvils sounding out clear and metallic, and the booming of the cannon again brought the audience to their feet and rounds of deafening applause followed until the piece was repeated. Then came the full harmonies of Wagner's March (from Tannhauser) and another grand effect from the chorus in the Star Spangled Banner, and then the vast multitude dispersed to spread their enthusiasm throughout the whole city.

The Second Day

The programme was more classical, but still the interest and excitement were unabated. Thousands were unable to obtain entrance to the building, and it was decided by the management to give a fourth concert on Friday, and an announcement to that effect was made.

The first piece was the overture to Ali Baha, which was given with great skill by the orchestra, and reflected great credit on them and on the conductor. Mozart's "Gloria" from the 12th Mass followed, and it seemed as if the reception on the proceding day had nerved the chorus to greater efforts. Certainly, they excelled in the cadences and in time. Gade's exquisite symphony in C (andante and allegro movements) followed, and was, perhaps, the best rendered of any orchestral piece given.



THE MERCANTILE LIBRARY BUILDING.

The grand chorus of the most exquisite of masters, "Sleeper's Awake," from Mendelssohn's "St. Paul," with its richest of harmonies, was finely rendered by the grand chorus. The melting of one chord into another, and the blending of the four parts, one, then another, rising prominently and then sinking into the rich choir, renders it one of the finest of compositions. The Prayer in "Moses in Egypt" followed, and called for an encore, notwithstanding the weakness of the bass solo parts.

Then came *the* event—the first and the only appearance of Camilla Urso. As the little lady appeared, the vast audience and the chorus rose and welcomed her with a genuine tribute of admiration. Again and again the applause died away, only to swell again in huge volumes of sound. Finally, quiet was restored, and the queen of the violin was allowed to play. The theme was a Grand Concerto by Beethoven. Any description of the wonderful rendering of the magnificent piece by the charming *artiste*, would be far too weak. The fullness, precision, and richness of tone produced by the most exquisite touch and finish, can only be appreciated when heard. The lowest tones, unfortunately, were inaudible to the majority of the audience. With characteristic modesty madame Urso declined giving a second specimen of her skill, although enthusiastically urged by her hearers.

The celebrated chorus from the Creation —"The Heavens are Telling," was, as a whole, exceedingly well given, with perhaps one weak place. Then followed the overture to Der Freischutz—the delight of the multitude, and with the "Anvil Chorus" and "America," the enthusiasm of the audience was again raised to its height, after a most surprisingly excellent rendition of that most difficult of choruses, the "Hallelujah." This may be regarded as the test piece for the chorus, and its fine performance is the measure of their success.

The Third Day

Was the children's festival. The stage was completely filled with the enthusiastic little ones, and the effect was similar to that of previous days. The pieces were all taken from the books used at the schools, and were all sung very nicely, the youthfu voices ringing out clearly and filling th whole of the building. The programme opened with the overture to William Tell, finely performed by the grand orchestra Then followed "America," sung in unison by all the children, "Come, Boys, be Merry," by the boys, and "Where the Warb-

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of Dewey & Co., publishers of the Scientific Press. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

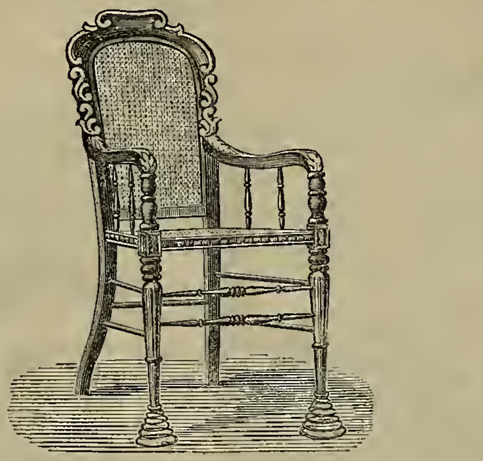
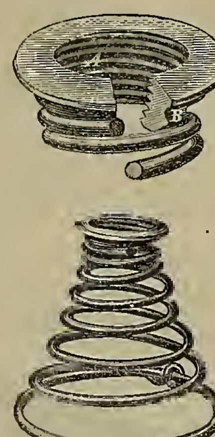
PATENT CHAIR SPRING.





PURINGTON & MAYOUX'S PATENT, NOV. 30, 1869.

This is the best Chair Spring yet invented, and will undoubtedly supersede all other devices of the kind, as it is SIMPLER, CHEAPER, AND MORE DURABLE. As a simple article of comfort and ease, it has no superior, and only needs to be tried to commend itself to universal and lasting favor. The Springs seen attached to the front legs of the chair in the engraving enables the person sitting in the seat, with very little effort, to give themselves

A Gentle and Easy Rocking Motion,

And also to rest themselves by change of position, by a very slight movement. It renders a common chair, at a trifling expense, equal or superior, in many respects, to a rocking chair.

The advantage of this Spring over all others consists in the manner of attaching it to the chair by the simple turning of a nut, which nut is also securely, easily and quickly adjusted to the Spring in a manner impossible for it to become inadvertently detached. The engravings show the parts both detached and as adjusted to the chair.

The nut is made of metal, and is provided with a screw thread, so that it can be screwed to the leg of an ordinary chair; and instead of weakening and splitting the leg, as in the case where a hole is bored and a screw inserted to hold and attach the nut, this method strengthens it The nut can also be very quickly and easily put on or removed.

The ease and convenience in applying the spring to the nut is readily seen. The top of the nut is provided with a collar or shoulder, and also an incline groove around the outer surface, so that the smaller end of the pan can be screwed to the nut; and its top coil being brought firmly against the shoulder, all oscillation from side to side is prevented. When the nuts are taken off, the chair is uninjured in its original form.

THIS IS A CALIFORNIA INVENTION,

And a superior article is now being manufactured. For particulars apply to

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,

"Live and Let Live,"

Is a good old adage, and we shall adopt it as our own. We do not pretend to do work at "less than cost," as some people advertise to do; but we do claim to do all kinds of printing as cheap as it can be done on this Coast—and we believe as cheap as it is done in Chicago. Customers, in the country or city, are invited to call in person at our office, or send their orders by mail or express, and they will be fairly dealt with.

Scientific Press.—The S. F. Mining Press has entered upon its twentieth volume with a change of name—Scientific Press. This is a journal devoted mainly to the interests of the miner, farmer and mechanic, and has well sustained its position in all respects. The price has been reduced to $4 per year, and we cannot too highly recommend it to all classes.—*Alpine Chronicle.*

DR. ABORN,
Oculist, Aurist,
AND
CATARRH, THROAT
AND
Lung Physician.
No. 22 KEARNY STREET,
SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox, Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan. 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal.), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California

To whom it may Concern.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.
WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.
VINCENT MONATTI,
Corner of Dupont and Green streets.
San Francisco, Dec. 25, 1869. 7v20-3m

California Steam Navigation COMPANY,

Steamer CAPITAL..........................CAPT. E. A. POOLE

" YOSEMITE.................. —
" CORNELIA.....................CAPT. W. BROMLEY
" JULIA..............................CAPT. E. CONCKLIN.

Two of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), one for Sacramento and one for Stockton, those for Sacramento connecting with light-draft steamers for Marysville Colusa, Chico, and Red Bluff.

Office of the Company, northeast corner of Front and Jackson streets.
B. M. HARTSHORNE,
13v12 **President**

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable*. The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Gluyas, Engineer of Construction. The working, drawings, etc., can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on large scale. 2v20-my

[Continued from page 137.]

ling Waters Flow," by the girls. The boys were perhaps a little more accurate in the time than the girls, who, however, received a rather larger share of applause. "Full and Harmonious," was in fact the next chorus, and "Home, Sweet Home," was encored. We noted, by the way, that in the first line the popular idea was followed instead of the composer's.

Camilla Urso now appeared amidst the applause of the audience, while the children greeted her with the waving of flags, which produced an exceedingly pretty effect. The kind little lady played Yankee Doodle, as if the spirit of fun were holding the bow, and then, more partial to the little ones than she had been to the big people the day before, gave them "Home, Sweet Home," on the encore.

The second part opened with the Coronation march from the Prophet, by the full military and reed band. Than came the "Mocking Bird," an alternate chorus with whistling responses—an original arrangement for the festival. There the boys were in their glory, and whistled away with surprising accuracy, and, of course, the greatest of spirits, calling an encore from a delighted audience. "Tell Me Where Do Fairies Dwell," by the girls, "Happy Land," by the full chorus, and "Come, Cheerful Companions," by the boys alone, were next in order, and "Star Spangled Banner," by the full chorus, the orchestra, the big drum, and the waving of flags by the children, was so well rendered, and with such fine effect, that the audience called for a repetition, notwithstanding that it was the last piece on the programme. A most curious, but pleasing effect was produced by having the children hum, instead of sing the second stanza.

Fourth and Fifth Day.

We go to press before Friday's concert, and can therefore give no description. The programme on this day will contain the choicest of the pieces already produced: Overture to Der Freischutz, by the grand military band; "Night Shades No Longer," from Moses in Egypt, grand chorus; the "Hallelujah," from the Messiah; overture to William Tell, grand orchestra and military band; "Sleepers Awake," the grand choral from St. Paul; the Anvil Chorus and Conradi's "Tour Round the World," ending with "America." On Saturday the children repeat their concert.

Names of Choristers.

We give the list of singers as we find them in the *Alta*, the only daily which attempts to give a list:

San Francisco Delegation.

SAN FRANCISCO MÆNNER CHOR.

John C. Sack, President; H. Holzhauer, Leader. Fifty singers.

First Tenor—Adler, Bourguin, Billermann, Russ, Craners, Damm, Fricke, Helgesh, Huber, Hilgeloh, Meyer, Reisemeier, Schuhart, Seitz, Steffens, Steinmetz, Karther.

SOLOISTS.

The leading soloists at the Festival are:

Soprano—Mrs O Putnam, Mrs R K Marriner, Mrs Robert Moore, of San Francisco; Mrs W C Little, of Oakland.

Contralto—Mrs Hayden, of Virginia City; Mrs Clements, Miss Fisher, Miss Mason, of San Francisco.

Tenor—Samuel D Mayer, Daniel Knight, of San Francisco; James Maguire, of Virginia City; Mrs Rogers, of Cincinnati.

Basso—J Stadtfeldt, R Wunderlich, W Campbell, and Mr Schwicardi, of San Francisco.

The Grand Ball.

The trustees of the Library decided to give, as a mark of their deep gratitude to Madame Urso, a grand ball for her benefit. This occurs on Friday evening in the Pavilion, and will probably be one of the grandest events of the kind ever known in this city. The appearance of the building and of the decorations by gaslight is said to be perfectly enchanting. One hundred musicians will furnish the music, sixty for the dancers and forty for the promenaders.

The Result

Is of course not known as yet, financially, but in every other point of view it must be proclaimed a grand success. The crowded houses attest the ideas of the hearers. There were 9,000 present the first day, and not less than 12,000 the second, according to careful estimates, a larger number than ever before collected together at any one time in the State. When one considers the obstacles to be overcome, the difficulties in getting together and training so large a number of voices and of instruments, especially for the first time, and the character of the music given, the highest praise must be awarded to the management. To have been one of the chorus (or orchestra) at Camilla Urso's Grand Festival in 1870, will be one of the proudest reminiscences hereafter. We hope a permanent organization will be effected, securing the repetition of similar and even larger festivals at regular seasons in the future.

◆

The Chamber's Brick-Making Machine in use at the East, and a model of which is to be seen at the Pacific Iron Works of this city, appears to be a most excellent device. The clay is taken from the bank and put into the machine, where it is submitted to a method of grinding and kneading, which mixes and tempers it more perfectly, it is claimed, than is possible by any other process yet discovered. It is then caught in the grooves of a screw and pressed through a rectangular die, in the form of a continuous bar of the thickness and width of a brick. It is then carried on an endless belt to a cutter, and cut into proper lengths. The bricks thus formed are carried by another endless belt through a chamber—the dusting machine—where a cloud of dust or fine sand is thrown on them by a blast of air, and the coating, thus formed, renders them nice to handle and improves their color when burnt. It is proposed to use the Adams steam kiln in connection with the machine. This kiln, which uses super-heated steam to prevent the overheating of the bricks nearest the fire and to diffuse the heat thoroughly throughout the kiln, and, moreover, economizes the fuel used, has been endorsed by Professors Horsford and Cooke, of Harvard University. We recommend these machines to the attention of builders.

◆

Scientific Events of 1869.—Hon. C. P. Daly, the new President of the American Geographical Society, enumerated in his annual address some twenty of the most notable events of the year. Among those which have not been especially laid before the readers of the Press, are the following: The invention and successful practical use of a self-registering compass by which every motion of a vessel can be recorded and preserved from the beginning to the end of her voyage. The discovery of trees of enormous height and magnitude in Australia, one of which was found to be sixty-nine feet in circumference. The discovery of great deposits of valuable coal throughout the whole of New Zealand, and the finding of coal upon the borders of the Caspian, verifying a prediction of Humboldt; both of which discoveries are of the highest importance to commerce. The assembling at Copenhagen last August of the International Congress of Pre-historic Archeology, under the auspices of the King of Denmark. The completion of the French exploration of the River Cambodia to the province of Tunan in China, the official details of which have not yet appeared. The expedition of the Russian merchant Soidorow in his own steamer around the coast of Norway and through the Polar Ocean to the mouth of the Pitschora.

◆

Death of a Famous Chemist.—Frederic Julius Otto, well-known from his excellent works on chemistry, died Jan. 4th of this year, at Brunswick, Germany. He was one of the most famous of the scientific men of the old world, and was an undoubted authority in his specific branch. In his death the whole world has sustained a great loss.

◆

The Mining and Scientific Press of San Francisco, Cal., has taken off half of its double name, and now appears as the Scientific Press. The Press is one of our very best exchanges, we read its columns with an avidity and pleasure, which would, we doubt not, be pleasant to the publishers to see. Its publication price, $4 per year, with the amount of reading matter, makes it worthy of support. We commend it to our friends. Messrs. Dewey & Co. are the publishers.—*Lake Superior Miner.*

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for $1.—*New Age.*

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

RETURNED.—Dr J. H. Paine. Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

MICROSCOPES of all kinds can be had at Muller's spectacle emporium, 205 Montgomery street.

New Mining Notices.

Cordillera Gold and Silver Mining Company, Morelos Mining District, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of February, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company No. 321 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco, Cal.

Hartwell Mining Company.—Location of Works: White Pine Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Treasurer, at the office of the Company in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-first day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

fy26 A. J. HOYT, Secretary.

U. S. Grant Mining Company.—Location of Works: Carlisle, Nevada County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of January, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of February, 1870, an assessment of two and one-half cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the fifteenth day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fifth day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5 No. 302 Montgomery street, San Francisco, California. feb12

North San Francisco Homestead and Railroad Association:—Location of Property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Association, held on the ninth day of February, 1870, an assessment of seven dollars and fifty cents was levied upon the capital stock of said Association, payable immediately, in United States gold coin, to the Secretary, at his office, No. 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the ninth day of March, 1870, shall be declared forfeited, and duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of March, 1870, to pay the delinquent assessment thereon, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.
Office, 415 Montgomery street, San Francisco. feb12

Pinto Mining Company.—Location of Works: Silverado, Pinto District, White Pine County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the third day of January, 1870, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
R Beverly Cole...bal. of	Nos. 112 162	1243⅓	$186 50

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

The reputation this excellent medicine enjoys, is derived from its cures, many of which are truly marvellous. Inveterate cases of Scrofulous disease, where the system seemed saturated with corruption, have been purified and cured by it. Scrofulous affections and disorders, which were aggravated by the scrofulous contamination until they were painfully afflicting, have been radically cured in such great numbers in almost every section of the country, that the public scarcely need to be informed of its virtues or uses.

Scrofulous poison is one of the most destructive enemies of our race. Often, this unseen and unfelt tenant of the organism undermines the constitution, and invites the attack of enfeebling or fatal diseases, without exciting a suspicion of its presence. Again, it seems to breed infection throughout the body, and then, on some favorable occasion, rapidly develop into one or other of its hideous forms, either on the surface or among the vitals. In the latter, tubercles may be suddenly deposited in the lungs or heart, or tumors formed in the liver, or it shows its presence by eruptions on the skin, or foul ulcerations on some part of the body. Hence the occasional use of a bottle of this *Sarsaparilla* is advisable, even when no active symptoms of disease appear. Persons afflicted with the following complaints generally find immediate relief, and, at length, cure, by the use of this *SARSAPARILLA: St. Anthony's Fire, Rose or Erysipelas, Tetter, Salt Rheum, Scald Head, Ringworm, Sore Eyes, Sore Ears,* and other eruptions or visible forms of *Scrofulous* disease. Also in the more concealed forms, as *Dyspepsia, Dropsy, Heart Disease, Fits, Epilepsy, Neuralgia,* and the various *Ulcerous* affections of the muscular and nervous systems.

Syphilis or *Venereal* and *Mercurial Diseases* are cured by it, though a long time is required for subduing these obstinate maladies by any medicine. But long continued use of this medicine will cure the complaint. *Leucorrhœa* or *Whites, Uterine Ulcerations,* and *Female Diseases,* are commonly soon relieved and ultimately cured by its purifying and invigorating effect. Minute Directions for each case are found in our Almanac, supplied gratis. *Rheumatism* and *Gout,* when caused by accumulations of extraneous matters in the blood, yield quickly to it, as also *Liver Complaints, Torpidity, Congestion* or *Inflammation* of the *Liver,* and *Jaundice,* when arising, as they often do, from the rankling poisons in the blood. This *SARSAPARILLA* is a great restorer for the strength and vigor of the system. Those who are *Languid* and *Listless, Despondent, Sleepless,* and troubled with *Nervous Apprehensions* or *Fears,* or any of the affections symptomatic of *Weakness,* will find immediate relief and convincing evidence of its restorative power upon trial.

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President..............................SAMUEL MERRITT.
Vice-President..............................MICHAEL REESE.
Treasurer..............................J. SELIGMAN & CO.
Secretary and General Agent.........W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm, H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

W. K. VAN ALEN,
Secretary and General Agent,

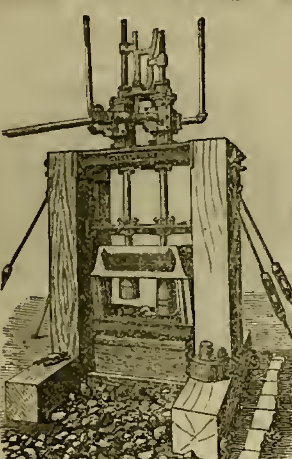
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

☛ The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for hemselves, at the office, **229** Fremont street,
1v1 San Francisco.

Crandall's Patent Spring Bed.

Manufactory, corner Front and M streets, Sacramento. COOLEY, HENRY & CO., Proprietors. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs, or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. ☞ Orders received at our manufactory, or at our agency in San Francisco. 7v20-3m

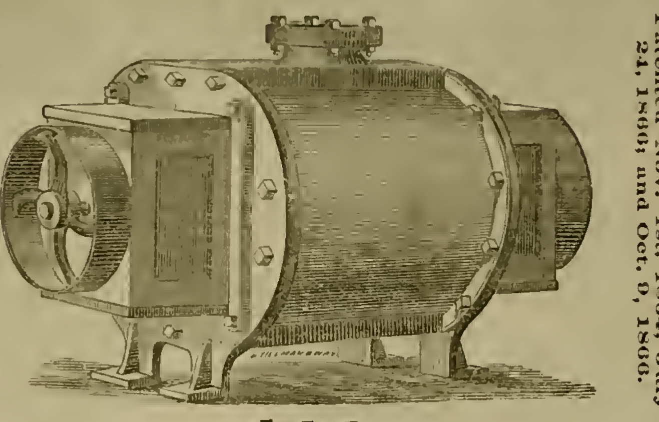
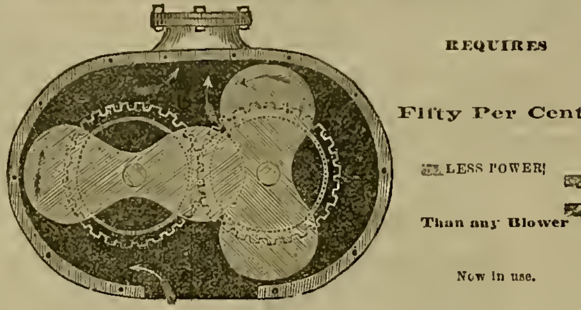
ROOT'S PATENT FORCE BLAST ROTARY BLOWER
MANUFACTURED BY KEEP & BARGION,
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** ☞ LESS POWER! ☜ Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 6v20-1y

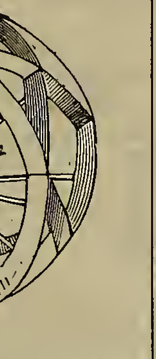
Loud vs. Cole—A Strange Decision.

We gave a couple of weeks ago a history of the patent case contested by Mr. A. C. Loud, of this city, and Senator Cole. We had been informed at that time merely that, on a third appeal, the decision rendered by the Primary Examiner, the Examiner of Interferences, and the Examiner-in-chief, all of whom were unanimous in giving the case to Mr. Loud, had been reversed by the Commissioner of Patents, who gave the case to the Senator. We were surprised at the decision, but had not then seen the reasons given for it. We have seen these now, but still continue to be surprised.

That Mr. Loud had made a model of the contested form, before the Senator claimed to have invented the device, is proved by the testimony of several witnesses, whose statements stand *unimpeached*. So much then, is certain, that Mr. Loud was the first to invent the device, he having done this in Angust, while the Senator invented it only in December. The Commissioner takes what seems to us an original view of the matter, and proclaims that Mr. Lond's invention is no invention at all. "I am clearly of opinion," he remarks, "that Loud made no invention of the X-shaped wheel in Angust 1868. *It is true he crossed two disks of paste-board;* but he had no idea of the mechanical truth which that act involved. On the contrary, when it became desirable to make use of that truth, it was not in his mind."



It strikes us that the assumption, that an inventor, who is studying how to effect a certain purpose, should take the trouble to make a model, and to show it to his friends as a good device for this object, (which is proved by witnesses) without having any idea of its effect, and without any purpose —"purposeless experiment," it is styled—is certainly a remarkable one. And when we consider, in addition, that the inventor immediately commenced testing a modification (as the examining experts at the Patent Office have officially and unanimously pronounced it) of this same principle, and that he had tried another modification—which he has patented here and in England—the assumption appears still more remarkable. [Of this last modification we give a sketch, and the reader can see that it is but the third step in the development of the idea, the V and the X shapes being the first two.] There is but one supposable ground for this:—That Mr. Loud did not mention the original idea while experimenting with the modification, which is assuredly no reason, any more than it is a proof that a person has never been aware of a fact becanse it does not recur to his mind even when circumstonces arise which might be expected to bring it to his recollection. That we sometimes do not think of a thing well known to us when we ought to remember it, is within the experience of everybody. But further than this, we have no proof or reason to suspect that Loud did not think of his original device at the time. If he did, he certainly was under no obligations to make it known to others.

The case will now be carried up before the District Court, and we shall watoh the development of the affair with great interest.

The Scientific Press,

Devoted to Scientific and Mechanical Progress, Mining, Farming and Mechanic Arts, contains more valuable Reading Matter than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the Press, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Engraving on Wood, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT, Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco, 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO., California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

New Propelling Apparatus.

We have been shown a new propelling apparatus, recently invented by Mr. I. E. Averill, of Sacramento. This invention relates to the method of operating feathering-paddles for boats. It consists essentially of a pair of vibrating arms which support, at their lower extremities, paddles so constructed that they feather when passing forward, but come into full action when they go back, pressing with their broad faces against the water and thus propelling the boat. The two paddles of a set work alternately, thus keeping up a continuous forward motion. There is a pair on each side of the boat, and the whole is arranged so that the vessel can be propelled in either direction—backward and forward, and steered as desired, the same as by a pair of oars. The inventor modestly limits the application of the device to smaller boats, canal boats, etc., for the present, and claims that by its use the vessel can be moved much faster and with less power than by means of oars. The men at work can stand facing the bows of the boat, and thus see what is going on before them, and as their work is confined to raising and pressing down the arms of the lever, which can be made as long as may be required, they have a comparatively easy task.

* * *

THE REMOVAL OF THE MECHANICS' PAVILION.—There is a strong movement being made to allow the Pavilion to remain in its present position a short time longer. The building cost $53,000 with improvements, and to have it removed now would seriously impair the revenues of the Mechanics' Institute, which is in need of all the money it can raise to extinguish its debt of $40,000. When we remember the noble action of the Institute in tendering the use of the building in aid of a brother association, it would seem as if those in the neighborhood might be willing to do the little kindness towards it of allowing the building to remain a short time longer, especially as the many are benefitted thereby. To remove any suspicions of their attempting to occupy Union Square permanently, the directors offer to give bonds to remove the Pavilion at the end of the year 1871.

* * *

A TERRIBLE MARINE DISASTER.—The U. S. steamship Oneida left Yokohama on the afternoon of January 24, and that evening was run into by the English iron steamer Bombay, which continued on its way, despite the signals from the sinking vessel. The Oneida sunk rapidly, and 120 persons, including most of the officers, perished! There is an intense excitement against the English captain for his inexplicable conduct. The only accounts as yet received, however, are those of the survivors of the wreck.

OUR THANKS are due to the Hon. A. A. Sargent for a copy of his bill entitled "a bill to amend an act granting the right of way to ditch and canal owners over the public lands, and for other purposes."

Improved Double-Acting Lift and Force Pump.

We illustrate this week a very neat and effective pump invented by a resident of this city, who is well known for several very valuable inventions. The nature of this particular device consists in the arrangement of a suitable port or water-way, with relation to the valve, buckets, supply and discharge ports of a double-cylinder pump, in such a manner that by working the valve pistons by means of a common brake lever, a crank, or a similar device, the water is raised or discharged in a continuous stream.

In the illustration, A, A′ are the two cylinders, B, B′, the valve pistons, worked by the rods G, G′; C, the water way, and D′, the discharge spout. On moving the lever, the pistons work in their respective cylinders. As B′ ascends, the water is drawn into the cylinder, A′. As it descends, the valve opens, permitting the piston to pass through the water. As it ascends again, the valve closes, the water is raised in A′, and forced through the passage, C, into the cylinder, A, and through the open valve of the descending piston, B, and out of the discharge spout, D′. On the return stroke, the valve of the piston, B, is closed, and the water forced out of A through D′, so that there is a constant flow all the time.

Only two valves are used in this pump. These are made of metal, and are faced with vulcanized rubber, and will stand any pressure required. They work on grated seats. The water passages through the pump and the pistons are large, and the friction of the water is reduced to a minimum. No valve chamber is used; all the working parts are simply the two pistons with their rods.

The cylinders are cast in one piece, without bonnets, valve chambers, or joints of any kind; and, consequently, the trouble of leakage is done away with. The cylinders have a brass lining (denoted by E), and brass piston rods are used. There is a strainer valve attached to the end of the suction pipe, which prevents foreign substances from passing into the cylinders, and keeps the pump always charged.

The arrangement of this pump is such, moreover, that should one of the valves become obstructed, it can still be worked as a single-acting pump; and hence it is much less liable to stop working than other devices of the kind. It can be driven by hand, horse, steam, or other power. It is so simply constructed, that the piston valves can be removed and replaced very easily; and it appears to be one of the cheapest, most efficient and durable pumps made.

The inventor, who has constructed quite a number of other very ingenious and useful devices, and who is well known here, is Mr. William D. Hooker, Berry street, San Francisco, to whom application may be made for any further information.

The second figure shows a very effective single-acting pump, which is made at Mr. Hooker's work, and which is available for the deepest wells—the so-called Adams' Improved Single-Acting Deep Well Lift and Force Pump. This requires no particular description. In the cut, *a* is the submerged pump barrel, *b* the discharge pipes, connected with the flange, *c*, at the top of the well, *d* the piston rod, *e* the handle. The pumps are claimed to be the simplest, most durable and cheapest pumps in the market.

WORK on the new San Francisco Mint is progressing favorably.

Sugar Planters and the Standish Steam Plow.

We have been shown the manuscript report of a meeting of sugar planters, held in the parlor of the St. Charles Hotel, in New Orleans, La., Feb. 10th, 1870, which passed the following resolution:

WHEREAS, a good and cheap steam plow is a desideratum in the agricultural industry of the Southwest; and,

WHEREAS, in the opinion of this meeting, the steam plow patented by Philander H. Standish, of California, appears to present many features to recommend it to our notice, therefore,

Resolved, That Mr. Philander H. Standish be invited to have one of his plows on exhibition at the next annual agricultural fair of Louisiana, to be held in New Orleans, pledging ourselves to do all in our power to facilitate the introduction of it to the notice of the agriculturists, and insuring success with profit.

D. P. KENNA, President.
F. E. ROBERTSON, Secretary.

Mr. Standish has just gone East by invitation of several capitalists in Massachusetts, and we shall expect his return in due time with an improved and thorough-built plow.

* * *

THE "LITTLE GIANT" QUARTZ MILL is being erected on Drumm street, near California. It consists essentially of a horizontal circular iron disk, on the face of which run four iron rollers, weighing 1,000 pounds each. The disk revolves about 40 times a minute, and by its motion, carries the ore from the center (where it is fed into the mill) gradually towards the circumference, and under the rollers, revolving twice as fast as the bed, where it is subjected to a combined striking, rolling and grinding operation, according to the inventor, and finally discharged at the outer rim. The ground ore is carried by elevators to bolters, whence the coarser stuff returns to the mill. The ore is previously broken up by an ore crusher. No manual labor is required except simply in feeding the ore-breaker.

The advantages claimed are: The action of the mill which reduces the ore quickly and perfectly; the economy in manual labor; the almost entire absence of liability to breakage; the small weight (some 6,000 pounds); the simplicity of the machinery; and complete confinement of the dust, so injurious to health and to the machinery. Mr. R. M. Vance is putting up the mill to "run it on its own merits." Its capacity is about 15 tons, which are reduced fine enough to pass through a 60-sieve. The public will have a chance in about a week to see the mill in operation.

OPINIONS OF THE CALIFORNIA PRESS CONCERNING SENATOR COLE.—A pamphlet containing extracts from the leading California papers has been sent to us. These extracts express opinions with regard to the Senator which are hardly complimentary to him.

* * *

SILVER IN KENTUCKY.—Reports from Louisville announce the discovery of a silver mine in Grayson County, Kentucky. Nothing definite is stated except the inevitable "richest ore ever found," etc., etc.

Communications.

Mills and Mines of Colorado.—No. VII.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Georgetown, I should have said in my last, is located about forty miles from Denver, and has an elevation of 8,000 feet, which sets it pretty well up from the plains. This year there has been considerable wind and a good deal of snow and cold, but, as a general thing, the winters are not any more unpleasant than in any mountainous portion of California of the same altitude.

The German Reduction Works

Are located at the upper end of the town, and are owned by Huepeden & Co. The works are more after the Freiberg system in the manipulation of ores, also in the matter of roasting. Instead of the reverberatory furnace, which all Germans cling to, there is used for roasting the

Bruckner Furnaces,

Which Mr. Huepeden assured me worked much better and more economically than the reverberatory. In every sense they seem to meet his views. They may be described as large iron cylinders, five feet in diameter and ten feet long, with cone-shaped ends. At the front end is the fire-place, and at the rear the dust chamber. In the interior of the cylinder is an inclined plane which keeps the ore continuously shifting from one end to the other as the cylinder revolves. The ore is received and discharged by an opening in the center of the cylinder. The interior is lined with common brick, which answers, Mr. H. says, all the purposes of fire-brick. The whole cylinder, when charged, revolves at the rate of one and a half revolutions per minute, turning on large wheels similar to, and of the size of, railroad car wheels. It is moved by gearing, and is put up in good solid shape, to go, stop or stand. Outside of the cost of shell and gearing there is nothing expensive about it. The works contain a Dodge crusher, a stave barrel for reducing ore, etc. There is also a 10-stamp battery of 450-pound stamps, which is not used. Eight wooden barrels of forty-two inch diameter, are used as amalgamators. The buildings are spacious, and everything has the appearance of activity and practicability, though not put together with any particular order. Attached to the works are offices for essaying, melting, etc., making it, on the whole, a pretty thorough working institution.

The Lead Tariff.

The ores in this vicinity are very rebellious, carrying a heavy percentage of lead, antimony and zinc; and, by the bye, this puts me in mind of the lead business and what I want to call your attention to, for the benefit of White Piners and others engaged in argentiferous works. There is now being made in Congress a great effort to take off the tariff on this article, and unless active measures are taken by all parties interested, it may be done; in which event the lead producers will be seriously affected. Colorado is wide awake in the matter; and I am informed by Commodore Decateur, who has given the matter close attention, that petitions will soon be circulated, protesting against a reduction of the tariff. It is a matter of as deep interest to the Pacific coast as to Colorado. If there is virtue in it, protests should be gotten up, or at once made to her representatives at Washington, and the interest protected. They can depend, of course, on the influence of the West, as all are more or less interested in it. I see by the St. Louis papers that they are proposing to establish a "Swansea" there by the erection of large reduction works. You in California and Nevada have got to hump yourselves, or Colorado is going to get this year five dollars of Eastern and European capital to your one, for the reason that she is so much nearer "the States," with rail communication to all parts. The road from Denver to Cheyenne, and the road (Kansas Pacific) from Denver to St. Louis, will be completed by the first of July next, and these bring the gold, silver and lead regions all within sixty miles of the railroads, and about the best portion of the gold region within thirty or forty miles. So brush up and hold your own.

Ore Shipments, Etc.

The following, from the Colorado *Miner*, will give your readers some clear idea of this section. Ores, in consequence of the expense of reduction, are all selected. Were a cheap process adapted, other ores could be worked, and these would be a general benefit: "The amount of silver bullion shipped in 1869, was 218,325 ozs.—coin value, $249,854.50; average in coin per ton, of all the ore treated, $134.32; ores shipped for treatment, 179½tons—coin value, $110,500; ores on hand, 4,087 tons—value, $299,480; grand total bullion and gulch gold shipped, $289,854; add ore shipped, $110,500; ore on hand, less cost of treatment at $45 per ton. $115,565, making a total coin value of $515,919; bullion, gold dust and ore shipped in 1869, $400,354. Deduct shipment in 1868, $91,829.35, shows an increase in 1869 of $308,524.65, an increase of 425 per cent. The increase in value of property in one year is about 50 per cent., and the poll list has increased 250 at the same time."

Primitive History of Man.

The following paper, containing a condensed statement of facts relating to the primitive history of the human race, was read by Professor Karl Vogt, at the last meeting of the Society of German Naturalists, and was translated and submitted to the Academy of Sciences by the President, Dr. Blake, at their last meeting:

It may seem from the title of my paper, that the subject is one which does not fall within the range of questions usually investigated by this Society, as appertaining more particularly to history than to the natural sciences. But I would observe, that if we have chosen the name of primitive history for our new branch of knowledge, it is that we mean by the term the investigation of the history of the human race independently of all traditional and historical sources, but by a method such as is applied to the investigation of other branches of natural history.

If up to the present time the earliest appearance of man on the earth is veiled in the greatest obscurity, it is that the solution of the problem has been left to the archæologist rather than to the naturalist. Since geology, palæontology and comparative anatomy have been brought to bear on this interesting subject, some light, at least, has been thrown on it, and I am happy to have this opportunity to communicate to you the facts brought forward at the recent Anthropological Congress at Copenhagen. We will consider these facts under three different heads.

First, and most important, is the probable time during which man has existed on the earth. We are aware that this period has been brought down within very narrow limits by traditionary belief and by legendary lore, and it is with these views that most of us have been brought up. It can, however, now be proved—with the same certainty as it can be proved that the earth revolves round the sun—that the age of man upon the earth far exceeds the limits that has usually been assigned to it. Geological and palæontological researches inevitably point to this conclusion, researches which have led to the discovery of the remains of animals together with human remains in the later deposited strata, on various points on the surface of the globe.

We are now in a position to prove that at least in Europe, and more particularly in the western part of Europe, in the western portions of France and England, and also on the borders of the Mediterranean, the human race existed at a time when these same lands were inhabited by extinct races of animals; animals, too, belonging to races which are now only found in more southern regions. We can affirm, with absolute certainty, that man existed in those regions when the mammoth, the elephant, the rhinoceros and the hippopotamus inhabited Europe. This fact is proved by our finding not only instruments made by man, but even human bones embedded side by side in more recent strata with the bones of these older animals.

If the age of man on the earth can be shown even in Europe to have extended so far back, we must then admit that this age reached beyond the period in which the geological changes that have given to Europe its actual shape took place, and when the European continent possessed a very different form from what it does at present. We can also plainly see that since the human race inhabited Europe, the climate must have undergone great changes; that men existed on this continent at a time when the northern shores of the Mediteranean were separated from the continent of Africa by a vast inland sea which now forms the Desert of Sahara, and the Straits of Gibraltar were closed by land which joined the two continents; that the Baltic was a frozen ocean which then covered the whole of the plains of Northern Germany and of Russia, so that Finland, Sweden and Norway formed an island at a time when England was united to France; in fact, that a complete change has taken place on the surface of Europe since this continent has been inhabited by the human race, and that man must have been a witness of these vast changes.

The proof of this gradual change in the climate since the continent was inhabited by man, is found in the extraordinary facts revealed by the investigations of the so-called Reindeer Period, which have been carried out in France by Lartet, in Germany by Krass, and in Belgium by Dupont. There can now be no doubt that after the race of the large southern animals had died out, a period followed, during which the reindeer, the polar fox, the musk fox, the polar bear, and other northern animals lived in the central parts of Europe, and were hunted by the then inhabitants of this part of the continent. There can be no doubt but that the fauna, both animals and plants, were such as inhabit an almost arctic climate, which must then have existed in the middle portions of Europe, and that since then, and also since man inhabited this continent, the climate has gradually become changed to what we find it at the present day.

These are facts which can be affirmed with absolute certainty; with a certainty as great as any deductive facts in other branches of natural science; and in the presence of such facts it is impossible to deny that man must have inhabited the earth for a much longer period than we have been accustomed to believe—for a period, in short, in which six to ten thousand years is but an infinitely small fraction; particularly when we remember that since man existed in Europe vast portions of the continent have been raised above the sea by a gradual process of upheaval; that the waters of the Northern Ocean must have been at least 400 feet above their present level, and that during this period the shape of the European continent has been gradually but completely changed. The discovery of these interesting facts has been owing to the investigation, under a geological point of view, of the diluvial strata of Europe, containing, as they do, abundant remains of extinct animals associated with human bones and implements.

Up to the present time, the earlier traces of man living at a time when the mammoth, the cave bear, and the elephant lived in these latitudes, have only been discovered in southern and western portions of Europe. It is at a later period, during the period of the reindeer, that we find the earliest human remains in Switzerland and Swabia, whilst in the northern parts of Germany and Denmark there are no indications that these countries were inhabited by man during the Reindeer Period; all human remains found in these countries being referable to a later period in the earth's history.

These facts would indicate that as regards Europe, the part first inhabited was that bordering on the Mediterranean, from which point the human race gradually extended towards the north in one direction, and to the elevated regions of central Europe. This is one class of facts that these investigations into the early history of our species have disclosed.

Another line of inquiry relates to the gradual development and civilization of the inhabitants whose remains have been discovered in these diluvial strata. Geology has marked out for us the comparative periods at which different portions of our continent has become inhabited, and clearly indicates the vast periods during which this portion of the globe has been the dwelling place of man; but a different method must now be pursued, in order to get an idea of the gradual development of civilization in these prehistoric races. The most striking facts in this connection are afforded by a comparison of the evidences of the social states of the races as indicated by their implements of chase and warfare, and by the character of their habitations with those of the lowest tribes of men at the present day. If, for instance, we compare the collection in the ethnological museum at Stockholm, in the section devoted to the Esquimaux and Greenlanders, with the instruments that have been found in France in the caves of the Reindeer Period, the similarity of the instruments is so marked that they can easily be confounded, and as the manner of life of the Esquimaux is determined by the climate in which they live and the customs they have inherited from their ancestors, as in these conditions the use of a few simple implements suffices to enable them successfully to carry on the struggle for existence, we are justified in concluding, when we find the same implements in the older strata of the caverns, that the former inhabitants of these caves in the south of France led much the same sort of life as our northern Esquimaux. The above example is brought forward to show more particularly the direction in which this branch of our inquiry has to be pursued.

If we will now consider what are the facts which the limited researches that have, up to the present time, been prosecuted in this direction, have brought to light. The golden age of the poets find no shadow for an existence in these prehistoric indications of the state of our race; on the contrary, they reveal to us man in the lowest state engaged in the struggle for mere existence. There can now be no doubt but that our ancestors were wild in the fullest acceptation of the word. We see that faint traces of civilization gradually appear, although so slowly that vast periods seem to have been required, even for the slightest progress. We find that men began to live together in fixed dwellings, the first condition for the development of civilization. Another fact about which there can be no doubt, as was clearly shown at the meeting at Copenhagen, is, that not only were the earlier inhabitants of Europe savages, but they were also cannibals, although it is probable that cannibalism then practiced was connected with some sort of supernatural belief. If they eat their enemies, after they had killed them, it was perhaps with the belief that the courage and strength of the slain might pass into their own body when they eat them. (The Chinese still employ bear's liver as a tonic for the nerves and to give courage, because the bear is one of the most courageous animals they know. They will pay any price for a bear's liver, this being the center of the fighting soul according to their psychology.)

As civilization advances, for instance, at the time of the lake buildings in Switzerland, when even before the use of metals agriculture and raising domestic cattle were followed, it appears that this upward progress was accompanied, if not brought about, by barter and exchanging manufactured goods with other tribes, and that one of the most important elements of our present civilization—the use of metals—was thus introduced into Europe.

As the result of our geological investigations, it was indicated that the earliest men that inhabited Europe came probably from Africa; so the remains of the cultivated plants which have been found in the lake dwellings in Switzerland show that these first objects of agriculture came not from Asia, as has been usually believed, but from Africa.

We now come to consider the third order of investigations that have been pursued for throwing light on the far-back history of our race, viz: Those that relate to man's anatomical development. We shall here find that the facts furnished fully justify the expression of the poet—"Es wachst der mensch mit seinen höheren zwecken." "Man becomes more developed, the nobler are his aims." If, indeed, not the whole body, at least, the brain. It is on this field of observation that comparative anatomy and physiology lend us such valuable assistance. This field has unfortunately been but little cultivated. Strange it is, although true, that the comparative anatomical investigation of man of the different races of human beings that now inhabit the earth, is in a less advanced state than that of some other races of animals. In fact, a great deal more attention has been paid to the race anatomical of many classes of animals than to that of man.

When, however, we look at the results these still imperfect investigations have furnished, we find a gradual development in the anatomical form, as the human race becomes more civilized.

◆

Parties who have been making examinations of the monster bird and animal tracks in the old sandstones at Turner's Falls (Mass.), claim to have discovered human footprints, clearly and well defined, in the same strata with those of animals and birds.

In France there are said to be 470 beetroot factories, 115 in Belgium, and 200 in Prussia.

Mechanical Progress.

Internal Friction of Double-cylinder Engines.

Engineering for Jan. 28th has an article on "High-class Steam Engines," in which, after showing the absurdity of the notion, recently enunciated, that all improvements which multiply moving parts are objectionable "refinements",—it goes on to combat the idea that exists in the minds of many engineers, that the internal friction of a double-cylinder engine is greatly in excess of that of a single-cylinder engine of equal power and equally good construction. We quote: "Now we are of course perfectly aware that in the double-cylinder engine a certain amount of extra friction is caused by the use of an additional piston, and of two or perhaps three stuffing boxes; but in reality this extra friction forms an insignificant portion of the whole internal friction of the engine, even when the latter is running light. When the engine is working with a load the percentage of extra friction due to the extra piston and stuffing boxes is still further diminished, for of course the friction of these parts is not increased by the load itself as is that of the crosshead guides, crank shaft bearings, etc. Again, the extra friction just mentioned must be set—supposing balanced valves not to be used—the diminished friction of the slide valves in the compound engine. The friction of a slide valve is due, first, to the difference between the pressure in the valve chest, and that in the exhaust cavity; and, second—during a portion of the stroke—to the difference between the pressure in the valve chest, and that in that end of the cylinder in which the steam is expanding, this difference of course acting on the area of the port covered by the valve. If now the two slide valves of a double-cylinder engine were each of the same size as that of a single-cylinder engine, the total friction due to the first of the above-mentioned causes, would be the same in both cases, the only difference being that in the double-cylinder engine the total difference of pressure would be divided between two valves instead of acting on one alone. In reality, however, the two valves of a compound engine are not each of the same size as that of a single engine of equal power, one being smaller, and hence there is a saving of friction. Again in the compound engine the cut-off of the steam of course takes place much later than in a single-cylinder engine working with the same degree of expansion, and hence the unbalanced pressure on the valves due to the second of the above-mentioned causes is less and the friction consequently less also."

Another Breech-loader.—Captain Graham Stuart, R. N., read a paper at a late meeting of the United Service Institution, upon his newly patented breech-loading cannon. We give briefly, from *Engineering*, the essential parts of the description: "An ordinary gun forging, somewhat enlarged in the internal diameter of the breech, is bored as usual, but the part of the boring in the breech is made two or three times as large as the remainder. Into this a sphere of metal, perforated as the bore, is introduced. One face of this has a *spiral* perpendicular projection. This fits against a bronze expansion ring fitted into the rear end of the bore, and acts as a wedge, completely sealing the breech. This sphere is mounted on gudgeons, which pass through the sides of the breech, and is turned by handles outside the gun. It rotates on its axis a quarter of a circle to open or close the breech. The perforation being accordingly in a line with, or at right angles to the bore, the sphere rests against a heavy perforated breech plug screwed into the solid breech. Through this the charge is introduced."

Zinc Paint.—Sorel prefers to use the chloride of zinc. He prepares it thus: 'Chloride of zinc (solution 50° B.), thirty parts; cream of tartar and hydrochloric acid, each one part; potato starch, four parts; and water, sixty-four parts. Stir in zinc white and chalk to proper consistency, and to give glance add a little linseed oil. To obtain a plastic mass like whalebone, take fifty parts potato starch, five parts oxide of zinc, and stir them into a mixture composed of fifty parts chloride of zinc (of 55° B.), one part cream of tartar, and one part hydrochloric acid."

The Bessemer-Ransome Stone.—We condense the following from the *Mechanics' Magazine:* "The Ransome stone is produced by dissolving flints in caustic soda and mixing the resulting silicate of soda with dry silicious sand and limestone powder. The paste thus formed is moulded to any desired shape, and then hardened by immersion in a solution of chloride of calcium. A shower bath of cold water drives off the chloride of sodium, and the stone, after being dried, is ready for use. The process of saturation with the solution of chloride of calcium is accomplished by hose playing on the block, as well as by immersion. Mr. Ransome has, however, in connection with Mr. Bessemer, recently obtained another patent, in which is claimed the "saturating, washing, and drying blocks or moulded pieces of artificial stone by means of a vacuum or pressure." Mr. Pye Smith has introduced a very ingenious arrangement for this process, consisting of an air-tight iron chest, into which a pipe is carried from a tank above the building. The chest has a moveable bottom, which is lowered by a winch and placed on a traveler. When the plate has been loaded with moulded material—the pieces being placed over vents made in the movable bottom—it is placed beneath the saturator, which somewhat resembles a diving bell. It is then screwed up in its place and well packed; the cock of the down pipe is then opened, and the chloride of calcium admitted under the pressure of a good head. It rapidly permeates the soft masses exposed to its action and converts them into durable stone, after which they are treated with water in the usual way."

A New Projectile.—A trial was made on February 9th, at Fortress Monroe, of a new double projectile, invented by J. W. Hill of Iowa, by which, as he claims, a shot can be thrown eight or ten miles. "The shot is conical, with a bore inside and a time fuse at the side. In fact, it is a small cannon itself. An eight-inch shot weighs 200 pounds before it is loaded. The inner cavity, or bore, is 3½ inches, and extends some eight inches. Into this is placed a half pound of powder, some tow, and a 12½-pound shot. The nozzle is stopped up by a brass plug in two pieces; the double shot is then placed in a cannon and discharged. The fuses are from five to forty seconds; at the end of that time the fuse ignites the powder and discharges the 12½-pound shot, driving out the plug."

The *Iron Age* says: "The principle is regarded as a good one. Our 15-inch guns throw a solid shot at least five miles. Load one of these with a double-shotted projectile, with a fuse arranged to discharge the small shot when the cannon ball has reached its highest elevation; a 15 inch shot would take a twenty or twenty-four pound shot without danger of bursting, and it is claimed that it would go farther from this elevation than it would from the ground."

Small Turbines.—Chas. Fowler, in an article upon this subject which he contributes to the *Scientific American*, says: "In some recent experiments of my own, with reference to obtaining a cheap application to light manufacturing purposes of the usually high falls of city supplies, I used a wheel only three inches in diameter, having twenty-four issues, each measuring one-tenth of an inch square. This wheel under a fall of thirty-five feet, drove a heavy English foot-lathe with sufficient power to turn a hickory block four inches in diameter; the water was conveyed to it through over one hundred feet of one and a quarter-inch pipe, having a number of sharp angles and curves. The wheel running unloaded made 2,288 revolutions per minute, ascertained by actual count by means of a worm and wheel."

Ingenious Lathe.—A convict in the Michigan State Prison has invented a turning-lathe, which turns sticks of variable thickness and of any degree of crookedness. It is principally used in turning scythe-snaths, but it will do any other sort of twisted work equally well. Besides doing the labor of a dozen men, it does its work with greater accuracy than could possibly be done by hand.

New Drill.—A late arrangement for drilling large holes in iron has a center pin which, having a thread cut upon it, screws itself into the body of the tool as the "cutters" of the drill advance. With this, it is not necessary to drill a small hole first, as a guide for the center pin.

Scientific Progress.

Ambrosine.

A new fossil resin, found in the phosphate beds of South Carolina, is thus described by Prof. Chas. U. Sheppard, in the *Rural Carolinian:* "An irregular oval-shaped mass of a mineral closely resembling amber, has been brought to my notice. The mass was originally of the size of a man's fist. It is of a yellowish-brown color externally, but within is clove-brown. It breaks with about the same facility as amber; has a conchoidal fracture, and a resinous luster. It is feebly translucent. Its specific gravity is but slightly above that of water. Indeed, small fragments of it when thrown into water float for a short time, until they part with adhering air, when they slowly descend through the liquid. It is strongly electric by friction. It melts into a clear, yellowish liquid at about 460° Fah. It gives off succinic acid before it melts. On fusion a dense yellow oil is volatilized, attended with an agreeable balsamic odor, wholly unlike that from the resins of our pines.

As it differs from any of the oxygenated hydrocarbons known, I have called it Ambrosine—from the two words amber and resin; to both of which substances it bears a resemblance. It is very combustible—burning with a bright, yellowish white light, a pleasant odor, and without leaving any carbon, or even the slightest ash behind. It is largely soluble in oil of turpentine, alchohol, ether, and chloroform, as well as in a solution of potash; and is feebly taken up by the strong acids, without suffering decomposition. It probably originated in some of the coniferous trees that existed during the pliocene epoch, when our phosphatic formation was in progress of deposition."

Where Does all the Carbon Come From?

Dr. Odling, F. R. S., has just commenced, at the Royal Institution, a course of twelve lectures upon the "Chemistry of Vegetable Products." We give an abstract of a portion of the first:

"As about 50 percent., by weight, of vegetable substances consists of carbon, the question asked in our heading presents itself. About forty years ago it was believed that the carbon of vegetable tissue came from pre-existing vegetable matter which had found its way into the soil, and there formed a brown substance known as 'humus.' Notwithstanding the palpable foolishness of the idea, it remained for years almost unchallenged. The humus theory was adopted by Berzelius and Sir H. Davy, nor was it overthrown till the year 1840, when Liebig, in a paper read before the British Association, heaped proof upon proof that it was untenable, and brought forth what is known as 'the mineral theory of vegetable nutrition.' Humus must manifestly be dissolved before it could enter the plant, and Liebig began by showing that humus is very insoluble in water, and will scarcely give it a color. Liebig assumed that the whole of the rainfall upon an acre of land during the whole time of the growth of the crop dissolved all the humus the water could take up, and then carried the whole of it into the plant; yet this would only account for a very small percentage of the carbon contained in the crop. It was also found by experiment that plants will often thrive in places where there is no carbon in the soil. Peas were grown in soil consisting of nothing but powdered burnt bricks. The palm trees of the West Coast of Africa yielded between the years 1821 and 1830 no less than 107 millions of pounds of palm oil, containing 32,000 tons of carbon, for exportation to England alone, and these trees grew upon a sandy soil containing little or no carbon. Another fact is that it is possible to greatly increase the quantity of carbon in a crop by spreading over the land mineral matter quite free from carbon. It is also a fact that growing crops increase and do not decrease the quantity of humus and carbon in the soil, and this is the most important circumstance of all; this has been proved by experiments with clover. Leaves must produce humus, but it is by no means so certain that humus must produce vegetation.

The carbon in plants must come from earth, water, or air, and as water as a rule contains no carbon, attention was at last drawn to the air. The amount of carbonic acid in the air is not quite constant, but there are usually four parts by volume of carbonic acid to every 10,000 parts of air. A room 25 feet square by 16 feet high contains exactly 10,000 cubic feet of air, and four of carbonic acid. The theater of the Royal Institution contains about 80,000 cubic feet of air, and 32 cubic feet of carbonic acid gas; therefore, the air in the theater contains a bulk of carbonic acid about half as big as the lecture table, and a bulk of carbon about as big as a brick. The pressure of the air is 15 pounds to the square inch, so that there is a column of air pressing with a weight of 2,000 pounds upon every square foot of the globe, and this column contains half a pound of charcoal. The quantity of charcoal, therefore, in the whole of the atmosphere of the earth is 3,000 billions of pounds, or far more than exists in the whole of the vegetable and animal worlds, and in the whole of the carbon in the coal deposits in addition."

Extraction of Copper from its Ores. Prof. T. Sterry Hunt and Jas. Douglass, Jr., have patented a process for the above purpose, based upon the use of a watery solution of neutral protochloride of iron for the purpose of converting the oxide or suboxide of copper into dichloride, and the use of sulphurous acid for decomposing any oxychloride formed in this reaction. The neutral protochloride is prepared by the double decomposition of protosulphate of iron with an equivalent of chloride of sodium. We copy a paragraph from the English patent specification which, with other pamphlets, we have received from Dr. Hunt: "One hundred and twenty pounds of sea salt, or one hundred and twelve pounds of dry chloride of calcium, or its equivalent of hydrated chloride, are to be dissolved with two hundred and eighty pounds of protosulphate of iron, (green copperas,) in one hundred imperial gallons of water. In place of the above salts we may substitute an amount of protochloride of iron prepared by any other method, containing fifty-six pounds of metallic iron. To the bath prepared in either way, two hundred pounds of sea salt are then added, when the solution is ready for use, and will be found capable of chloridizing and dissolving about ninety pounds of copper. The power of brine to dissolve the dichloride of copper formed increases greatly with the strength and temperature. The proportions above given are convenient, but in case of poor ores, a solution of one-half the strength may be used with advantage. * * The pulverized oxydized ores are to be digested in the above with frequent agitation. Heat is not necessary, but it accelerates the solution of the oxide of copper. When the solution is complete, the liquid is drawn off and digested with metallic iron, by which the copper is thrown down as cement copper, two parts of iron yielding three parts of metallic copper."

New Thermo-Electric Pile.—Messieurs Mure and Clamond have brought out a new pile, of which *Le Genie Industriel* thus speaks: "It is made up of sixty elements. These consist of small bars of lead, or native sulphuret of lead, and of plates of steel. The bars are forty millimetres long by eight thick, and the plates of steel are fifty-five millimetres long by eight broad, and 0.6 thick. In these couples galena is the electro-negative element; iron, the electro-positive. The form of the bars is such that by placing them side by side, they form a ring of twelve couples, of which the interior is formed by the extremities which are to be heated. They are united in tension by means of tin solder. They are isolated from one another by thin mica plates. By placing five of these rings in a vertical column, a battery of sixty couples is formed. These rings are isolated and separated by washers of asbestos. The whole is firmly held between two iron rings by means of three bolts. The pile thus forms a hollow cylinder. The apparatus is heated by a gas burner, consisting of a steel cylinder fifty-six millimetres in diameter, closed above, open below, and pierced with small orifices. This is placed in the center of the pile. A tube pierced with holes surrounds this cylinder and distributes the gas uniformly around it. The gas rises, and arriving at the orifices in the burner, meets the air which is escaping from it because of the draft of the tube of steel that surrounds the apparatus. Forty couples have an electro-motive force equal to that of a Bunsen element."

An Eighty Years' Survey.—The trigonometrical survey of England and Wales, on the scale of one inch to the mile, was finished during the first week of the present year. It was commenced in the year 1791.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Roaster.—*Miner*, Feb. 19th: We have assurances from a gentleman who has extensive interests in Alpine, that a furnace devised specially for our ores will be introduced in the spring. It is to combine several features now in use with some entirely novel.

BUTTE COUNTY.

Fluming.—Oroville *Record*, Feb. 26th: Mr. Lytle and others, interested 13 years ago in the famous Cape claim, at the mouth of Morris ravine, contemplate fluming a portion of that claim the coming summer. There were some 400 feet of that extraordinarily rich river claim left unworked.

CALAVERAS COUNTY.

Railroad Flat.—*Chronicle*, Feb. 26th: The track connecting the Petticoat mill and main shaft is completed, and a car to carry two tons will hereafter transfer the ore. Near the bottom of the shaft, which is 200 feet in depth, a tank has been constructed 30 feet long to receive all drainage above its height, no water of any consequence appearing below. Whatever water may accumulate below will be conveyed into the tank by their old pump, a new 8-inch one raising it thence to the surface, one rod working both pumps. Two weeks' time will put this mine in perfect working order.

EL DORADO COUNTY.

New Quartz.—Placerville *Democrat*, Feb. 26th: H. L. Robinson & Co. are to build a 10-stamp mill on their claims at Prospect Flat, two miles from this city. They expect to have it running next month. Their claims are on the famous Blue lead.

Dickerhoff & Goyen's new mill is hammering away on tailings, and paying handsomely.

MARIPOSA COUNTY.

Jenny Lind.—*Gazette*, Feb. 25th: We learn that Messrs. Kocher & McCullongh have commenced work on the Jenny Lind mine, an extension of the rich Washington lead, Hornitos. They have applied for a Government patent to the mine.

MONO COUNTY.

Dunderburg.—Carson *Appeal*, Feb. 22d: The tunnel by which the ledge is tapped at a depth of 160 feet has been run clear through the lode, which is upwards of 30 feet in width. An assay shown us gives $16.96 in silver, and 84.40 in gold—making a total, per ton, of $101.36. The ore was taken at random from one of the drifts.

NEVADA COUNTY.

Bloomfield.—*Transcript*, Feb. 23d: The North Bloomfield Gravel have not been able to wash much yet, in consequence of a lack of water. R. C. Black, after a run of 10 days, cleaned up $1,000 above expenses.

Randolph Flat.—24th: Wehster & Co. are putting in sluices, and will commence washing next week. Grant & Co., adjoining, are to sink a shaft and open their claims, and other companies are getting ready to start up. The prospects still continue good.

Good Heads.—Leavitt & Co. are running 300 inches of water. Their flume runs the entire length of the town and dumps into Deer creek. Marselns & Maltman are running six hundred inches in Manzanita hill. The South Yuha Canal Co. are running their ditches to their full capacity, and are unable to fill the demand by nearly 1,000 inches.

Deer Creek.—25th: Several days ago some Portuguese struck a pay lead on Deer creek, from which they crushed $45 in a hand mortar. Recently a number of pay spots have been struck.

Prospecting.—Yesterday nearly 100 persons were prospecting on the hill-side near Wood's Ravine, for quartz. Sloan & Dougherty struck a ledge from which they took out some splendid specimens. We were shown several which were filled with free gold. There was considerable excitement.

Good Prospects.—John Senner did some '49 prospecting with a rocker, on Lassen ravine, below the foundry. He took out dirt that paid at the rate of $6 per day.

You Bet.—26th: After the last run of six days, Brown, Brothers, cleaned up $9,000. This cement claim has for years been rich, and the average yield has been $5,000 per week. They have now plenty of water to keep the mill running.

The Idaho Sale.—An injunction was filled by the Idaho Co. against the sale of the interest of John H. Henning, deceased, the company claiming that there is no interest in the mine belonging to that estate.

The Prospects.—27th: The prospectors are developing new deposits, the quartz mines are yielding handsomely, and the hydraulic mines have abundance of water, and are busy in every locality. The recent storms have given abundance of water, and the March rains will probably add enough to make the supply fully up to the average, while the mildness of the weather has permitted operations to be carried on without interruption.

Clean Up.—*Gazette*, 23d: Cohh & Co., of Scotch Flat, cleaned up on Monday from 37 out of 77 boxes in their gravel claims, $1,395.63. This was from 13 days' run.

Machinery Sold.—John McDermott has purchased from the Bowery Co., at Grass Valley, the hoisting and pumping machinery of the Gold Tunnel mine.

Globe Nozzle.—Two of Craig's nozzles, recently cast, are 27 inches in diameter. One is for the hydraulic claims of John Arhegast, and is to serve under 125-foot pressure. The other will be used at the Last Chance claims at Blue Tent, under a pressure of 225 feet.

Empire.—*National*, 23d: Excellent ore is being taken out in the Rush & Laton ground. The incline is down 360 feet. The ledge is 20 to 30 inches in thickness.

PLACER COUNTY.

The Auburn Strikes.—Grass Valley *Union*, Feb. 26th: Charles Eaton, who purchased the St. Patrick ledge, informs us that the Good Friday is still turning out very rich rock, and that the St. Patrick is paying largely. Near the St. Patrick, a few days since, a miner took out over $400 in one day, from the croppings of a ledge. Mining in the district is active, the residents having formed companies for that purpose.

PLUMAS COUNTY.

Taylorville.—Cor. of Quincy *National*, Feb. 19th: The Lehanon Mill in Genesee Valley will soon commence crushing rock. Judkins & Kellogg are crushing, with good results, and the reservoir is filling up fast. On the whole, the mining interest looks encouraging.

North Fork.—There are but few miners at work this winter. Bryon & Boston are doing better that at any time before. Benham & Emmons are doing well on Columhia Bar. The Dutch Hill Co. are boring ahead in their tunnel, taking out some dust. Ferguson & Wsggoner are taking out dirt to wash in the spring. Mechlin is getting good prospects in Barker Hill, and running out dirt for spring washing. A company are now working the old Italian diggings in Bntt Valley, making five or six dollars per day to the hand.

SIERRA COUNTY.

Struck it Rich.—*Messenger*, Feb. 26th: We learn that rich prospects have been struck, during the past week, in the Tagnasty claims, at the lower end of Dnrgan Flat. The tunnel has been prospected with vigor, day and night.

Kanaka.—We understand that the mill recently cleaned up satisfactorily after a short run.

Clean Up.—Ned Leonard's mill cleaned up after a sixteen days' run, about $1,200. The ledge is narrow, and only enough rock could be obtained to run the mill in the daytime.

TRINITY COUNTY.

Douglass City.—Cor. of *Journal*, Feb. 19th: The last storm started all the miners at work, most of whom had been ready for the rains. All the claims worked last year, with two exceptions, are running, while some new ones are being opened. None of the claims have less than 140 feet, and that of Tourat & Murphy, on Fillihnster Flat, reaches up to 190 feet.

British Columbia.

The Peace River Mines.—A Victoria telegram of Feb. 24th says: "This Colony is greatly excited over the news from the river; the lower country will be nearly deserted in April. The miners find in their sluices nuggets of gold and lumps of natural silver in about equal proportion. The belief of the miners is, that a great silver as well as gold country has been discovered."

Arizona.

Big Bug.—Prescott *Miner*, Feb. 12th: L. C. Gray, arrived Tuesday with a bar of gold worth between $1,800 and $1,900, the proceeds of 80 tons of ore. The little mill was less than nine days producing the above amount of gold.

Pine Grove District.—Some 15 of the prospectors near Bradshaw mountain remained when the majority returned disgusted, and were rewarded by finding what, in the opinion of many, is the richest gold bearing quartz lode on the Pacific slope. This ledge is near the summit of the mountain, in a thickly timbered and well watered region. It has been traced 5,000 feet, and upwards of 20 claims have been located upon it. The rock is partly decomposed, and the gold is free. It is thought that it will yield from $200 to $300 per ton in arastras, but this is speculation. Placer mines were also struck.

Walker's District.—The miners are almost tired waiting for water. The same is the case in Hassayampa district. The Sterling mill and Charlsy Taylor's arastras are in running order. We find nothing new from Wickenhurg and Walnut Grove districts. The placer miners of Lower Lynx creek are bringing in considerable gold, for which our merchants pay $18 per ounce.

Colorado.

Sparks Lode.—Central City *Herald*, Feb. 16th: The crevice is six feet wide and the ore easily mined. Water sufficient to run a 40-stamp mill can be obtained from the mine. Before sinking further it will be necessary to put in a large pump. The parties propose to erect a mill. Mr. Fagan starts east in a day or two to procure machinery.

Central Co.—The Central Co. have resumed operations. Their property is on the Roderick Dhu, Prize and Gunnell lodes. It is mostly developed from 200 to 300 feet. The Lsxington mill will be removed to their water power on North Clear Creek.

Freeland Lode.— Georgetown *Miner*, 17th: The Colvin Co. owns four claims on this lode in Trail Run. The incline opening them is over 140 feet, and a drift has been run thence 50 feet. The crevice is six feet in width, and the ore streak varies from 12 to 24 inches in thickness. The mill is a genuine 10-stamp California mill; there is also one Wheeler pan, and several small Bartola pans, for testing ore.

Sherman Mountain.—The Hise lode has a vein in the bottom of the 90-foot shaft, which is from two to two and one-half feet in width, eight inches of which is mineral, averages about $400 per ton. The General Marshall lode does not carry so rich an ore, the yield of its mineral in silver averaging $150. It is rich in galena, and will yield from 1,000 to 1,300 pounds of lead to the ton. Immediately below are the Monster and Kit Carson lodes, carrying ore which contains $200 to $350 per ton, and yielding from 50 to 55 per cent. of lead. Below are the Geo. D. Prentice and Sallie Ward; the former of which has a crevice four to five feet wide, rich in lead, and containing 100 ounces of silver per ton. The Sallie Ward is opened by a shaft 30 feet in depth, which exposes a crevice four and one-half to six feet in width, and a vein of ore which yields $500 to $600 per ton, in silver.

Brown Mountain.—The main shaft on the Terrihle lode has struck into another body of mineral equaling in width and richness anything that has been found. The depth of the shaft is now 240 feet. Mining on the Brown is continued with great vigor. A body of mineral, sixteen inches in width, has been struck in the lower level. Both levels are being pushed west rapidly. The drift from the discovery shaft on the John J. Ros will strike the Frothingham in twenty feet. In this shaft is exposed a body of ore which yields from 170 to 350 ounces of silver to the ton. The vein is, in places, 12 feet wide. The Hercules lode is not at present worked.

Hoosier Mine.—Bouldsr *News*, 15th: Work has been suspended for a short time. A working test is to be made of some 30 tons of ore already out.

Idaho.

Hill Diggings.—Boise City *Statesman*, Feb. 19th: There is a report of new discoveries in the hills seven miles from this city, in the direction of Idaho City. Some Mexicans have been camping there. They packed some dirt down to water, and a flour-sack full yielded three bits.

The *Statesman* says that the mines on Cedar creek which are raising so much excitement in Montana turns out to be in Idaho, about 15 miles over the line.

Corduroy.—*Avalanche*, Feb. 26th: As rich gold ore as ever was seen in the camp, is now being taken from the Corduroy. From several tons in the ore house, we selected a specimen of average richness, literally stuck full of gold. The shaft is down 160 feet.

Montana.

Philipsburg.—Cor. of Helena *Gazette*, Feb. 17th: A rich opening has been made in the face of the Comanche Extension, upon No. 3, S. W. The mill is now cleaning up from Queen rock, while the batteries are crushing Comanche.

Diamond City.—Monnt, Cook & Co., have succeeded so well with their large steam pump, that, not only can the ground above it be worked, but the ground adjoining it on the lower side can also be drained by it. For this lower ground, D. P. Rankin is said to have paid $8,000.

Another Brick.—The Whitlatch mining Co. had a brick yesterday, worth $4,354.26. This was the first clean-up from the new mill.

From Cedar Creek.—Ben Dittes arrived on Sunday. He gives favorable reports. The upper district is known to be good. Down the gulch as far as 72 bed-rock has been found and pay struck; below this drain ditches are being run. In Oregon gulch, by means of drain ditch and shaft, the miners have reached a depth of 23 feet. No bed-rock has yet been reached, and they are still going down. Good prospects are found.

More.—A correspondent of the Virginia City *Times* says of the Cedar creek mines: In Illinois gulch no one has thus far got more than a color, and there is no telling how deep it is to bed-rock. In Wolverine gulch things are about the same. There is a good deal of talk about these gulches, but nothing definite is known of them yet.

Again.—J. D. Allport writes the *New North-West* Feb. 2d as follows: I have just come from the Cedar Creek mines to procure provisions, and will return in the morning. I bought one-half of two claims to-day for $300—one on main Cedar and one on a side gulch. I wish you to come down immediately. The mines are rich beyond doubt. My authority is, what I have seen from my own work and panning. I dare not say anything about prospects; you might think I was excited. There will be plenty of litigation here.

Frank Decker writes: "This will be the best camp in Montana." The journal above named says he is a good miner, and a reliable man.

Silver Star.—*Times*, 18th: The Stevens & Trivitt mill will start up on Monday with both batteries. The Iron Rod lode is still improving in richness. The upper tunnel on the Green Camphell is in 420 feet, and the lower tunnel 376 feet.

Cable.—*New North-West*, Feb. 11th: The boiler of the Hanauer mill was burned last Monday, necessitating a stoppage for repairs. The mill has been 20 days crushing 600 tons of good quartz. The Cameron Co. struck water in their shaft, and had sent to Phillipsburg for pumps. About 160 tons of ore are now at the mill, and 30 or 40 at the mouth of the shaft.

Ditches.—Deer Lodge *Independent*, 12th: We learn that the two companies constructing ditches to take the water of Race Track to Prairie and other gulches, are making rapid progress, and there is now no doubt but both will be completed early in the spring.

Nevada.

COPE DISTRICT.

Bull Run.—Elko *Independent*, Feb. 6th: Gov. Chillis and party are working the Fountain Treasure mine, discovered last summer, and represented as one of the best. A party of six men design leaving here to-day, to commence work on the Porter, Central Pacific, Franklin and Western mines, owned by Tucker & Co.

HUMBOLDT.

Mining Items.—*Register*, 26th: Judge Coulter has shown us a specimen from the Jeneson ledge, which is very rich in both silver and gold. The ledge is five feet between walls. A shaft 80 feet deep has been sunk. District is nearer the railroad than any other in the county, being but two or three miles distant....In Gold Run district, the Shepardson, Cumberland and Register mines are looking better than ever....In Battle Mountain, several new districts have been made....Trinity district has taken a fresh start under Mr. Moshsimer, who has bought the Oreana furnaces and mill. He is making arrangements to enter into the smelting business on an extensive scale.

Galena District.—Cor. of same: The Shiloh has been leased to H. L. Spargur, who is extracting ore at the rate of six tons per day....The Buena Vista is daily turning out large quantities of high grade ore. ....The tunnel intended to tap the Butte is in 115 feet....The Grant, owned by the R. R. boys is panning out splendidly; the shaft is down 45 feet, with a vein of two feet....A big excitement has been raging over a new discovery a half mile southwest from the Butte. A vein has been discovered, which surpasses anything in the district. The first assay made was $3,600; a second was over $4,000. The vein can be traced for quite a distance, and three locations have already been made on it. Shafts are being sunk on each.... The Little Giant mill, after a thorough overhauling, is again under headway.

REESE RIVER.

Silver Bend Ore.—*Reveille*, 22d: A short time ago some eight tons of ore from the El Dorado mine were hauled to the Manhattan mill for reduction, the yield of which was $202 of silver per ton. The lot was selected from the dump, which had been repeatedly overhauled.

Substantial Returns.—Joseph Moss, one of the lessees of the Troy mine, showed us the returns of 20 tons of ore just reduced at the Manhattan mill. Of the first class there were 2¼ tons, the pulp assay of which was $1,127.88; of the second 20 tons, the assay of which was $414.17. This makes the gross yield of the 22¼ tons $8,831.17.

Toiyabe Shaft.—We were shown to-day ore from a vein recently cut in the shaft of the Toiyabe Co. in Lander Hill. The vein at the depth of 323 feet is 21 inches wide and well loaded with excellent sulphuret ore. A piece taken from the drift yielded by assay $300 per ton.

Marshall Canon.—The owners of the S. C. Baker mine are developing their property handsomely. The work of exploration is now done through a vertical shaft, four feet by six, timbered to the depth of seventy feet, from which point the work of sinking was recently let by contract.

WASHOE.

Ophir.—*Enterprise*, Feb. 27th: The water in the new shaft was down to within 60 feet of the drift. The company are now satisfied that they will shortly be able to get into their drift. In the old works above, the water has been reduced 157 feet. The pump and two large hoisting tanks are kept in constant operation.

Segregated Belcher.—In the drift going north on the 500-foot level along the east wall the ore is assaying better and growing wider. They are now running a drift through the deposit to the Belcher south mine. The drift west from the 230-foot level is in 275 feet. They are taking out 25 to 30 tons of ore per day, and have on dump 3,000 tons of good milling ore.

Hale & Norcross.—The Co. are extracting 170 tons of ore per day. During the past week they have been sinking their main shaft for another level.

Occidental.—They are still at work on their lower tunnel and upon the winze and "rise" between the north and south mines. From the upper works they are taking out the usual amount of ore.

Gould & Curry.—Since our last report the Co. have struck a very rich and apparently extensive deposit of ore in the old mine, 350 feet below the surface. The assays run all the way from $500 to $2,000. The deposit is supposed to be the old Potosi streak.

Virginia Consolidated.—This Co. have their drift in 50 feet from the station on the 500-foot level. They have no water in their drift, and but little in their shaft.

Caledonia.—The Co. are taking out 30 to 50 tons of ore per day. The back ledge as far as opened, is looking well.

Outside Mines.—Quite a number of mines will probably be worked the coming summer in the vicinity of Silver City, that have lain idle for years. Parties are also talking of starting in upon some of the old mines in Palermo district.

Sacramento & Meredith.—This Co. are taking out a considerable amount of ore, which is being piled up for reduction when their mill shall have been built.

Savage.—About the usual quantity of ore is being extracted. In some parts of the mine there is considerable improvement in the quality.

Chollar-Potosi.—This Co. are taking out the usual amount of ore from their upper works.

Yellow Jacket.—They will be able to ship a large quantity of ore during the coming summer, which they can reduce at small cost at their mill on Carson river.

Kentuck.—About the same amount of ore is being extracted, and nothing new has been struck.

Crown Point.—It is still richer in porphyry than in quartz, but there is always hope.

Sierra Nevada.—The mill is kept in constant operation, and there is plenty of ore coming out and in sight.

Sutro Tunnel.—The Tunnel was yesterday in 795 feet. The ground is hard, requiring blasting, yet the work is progressing rapidly.

Imperial-Empire. — Still going ahead with shafts and drifts.

WHITE PINE.

Weekly Mining Review.—*Empire:* Several mines that had started up during the week have suspended operations on account of the storm. The smelting works of Van Wyck & Co., and of Mr. Partridge have been compelled to stop by the bad road. Hauling or packing is impossible.

Items.—*News:* In the Blackfoot, on Blue Hill, a 30-foot tunnel has been run, and a winze from it follows the ledge down 75 feet. The vein is here nine feet, all pay ore.... Work on an extensive scale is to be commenced in the Hidden Treasure to-day (24th).... Snell is pushing work in the Mammoth. A drift is being run both east and west.... The Poor Boy ledge has a shaft down 34 feet, a vein of fine smelting ore 4½ feet wide, and 30 tons on the dump. .... Mineral Point mine, owned by Uncle Billy Forsythe and E. S. Barney, is turning out very rich ore from the bottom of the 65-foot shaft.... On the 25th, $11,200 bullion was shipped West, and $6,200 East.

Smelting Items.—*Empire:* Mr. Partridge writes that his smelting works (the Magary) turned out 58,000 pounds of base bullion in a run of six days, without injury to the lining or any other part.... Higgins & Murphy have started up their smelting works at Shermantown, and are turning out a large amount of bullion.... Van Wyck & Co. last evening (23d) had a pile of over 200 bars, weighing nine tons. One thousand pounds of metal was run off into bars in four hours.... Jack O'Brien, now in New York, says he has found a man who can work over base ores and save all the metal. We would not be afraid to guarantee such a man 75 per cent. on the money invested, if he will come. The country is full of ledges which will yield ores—one-half of which is lead, silver, and copper. These ores are now selling from $8 to $30 per ton, and will yield from $50 to $500 per ton. We therefore look forward to the opening of spring for a wonderful stride in the development of this branch of mining throughout all the base metal districts of Nevada, for smelting furnaces and base metals form all the speculative talk in mining circles just now.

Derby.—*Empire*, 26th: This mine has been lying idle for some time past, owing to the fact that a dispute to its title was set up by the Chloride Flat Co. Yesterday this title was settled. The Derby on the upper edge of Chloride Flat, and has always yielded high grade ore.

Ely District.—*News*, 24th: There are some 300 men in the town of Ely, and considerable building is going on. The Pioche ledge is the largest, but there are 25 or 30 parallel with it. The nearest water is five miles off. Wood is plenty, and the climate delightful. John Ely's mill turns out $500 to $800 daily. No trouble anticipated with Mormons.

Eureka District.—*Empire*, 24th: This will, during the summer, develop into a wonderfully rich camp. Besides the great mines, there are a score of others, richer but less extensive. The lowest yield from ore milled from eight different ones was $204 to the ton. Page & Corwin will have $50,000 worth of ore out by early spring. The Buel furnaces are almost ready to start. Col. Robbins turns out about a ton of bullion daily. The *News* of 26th says Col. Buel has gone East to make arrangements for shipping his bullion direct to New York without change of cars. He proposes to ship by the car load, and it is probable that most of the base bullion of Eureka district will go that way. Dick Willson's furnace is nearly ready to start.

Shoshone District.—*Empire*, 23d: Shaft on the Indian mine is down 60 feet, and shows ore worth $200 per ton.

New Mexico.

Mining Items.—*Press and Telegraph*, Feb. 12: An Indian gave to Mr. Lowthian a piece of quartz which he said he found in a two days' ride from Elizabethtown. He said there was a ledge nine feet wide. We have seen a small piece of the quartz, marvelously rich in free gold.... McIntire & Co., at the head of Grouse, are tunneling on the Mexican lode. They have one foot of quartz, said to be rich.... The shaft on the Tecumseh is down 60 feet. The crevice is opening out again.... Rowe, Young & Co. have struck the Great Eastern vein in their new shaft.... The Gladstone tunnel is being driven in four feet a day.

San Francisco Mining and Scientific Press.—The proprietors of this paper have dropped the word "Mining" from its title, so that it is now, as of yore, entitled the "Scientific Press." In thus dropping the word "Mining" it is far from their intention to let up on that subject. We reiterate what we have often before said: that there is no better or cheaper paper than the Scientific Press published in America, and no miner, farmer or scientific man should attempt to grope his way through the world without it. It is published by Dewey & Co., San Francisco, and furnished at the low price of $4 per annum.—*Arizona Miner*, Jan. 29.

San Francisco Mining Stock Market.

MISCELLANEOUS STOCKS.

During the past week we note sales of Spring Valley Water Company's stock at $65@65 50 per share. This company will disburse its usual monthly ½ per cent. dividend on the 10th inst.——Sixty shares of Pacific Insurance Company's stock realized $112 per share.——The Merchant's Mutual Marine Insurance Company will pay its customary monthly dividend on the 10th.——The North Beach and Mission Railroad Company paid its dividend on the 1st.——The San Francisco Gas Company disbursed their usual monthly dividend on the 1st.——The Pacific Bank paid its annual 1 per cent. dividend on the 1st inst.——The Black Diamond Coal Company disbursed a ½ per cent. dividend on the 3d.

MINING SHARE MARKET.

We note a very perceptible improvement in mining stocks during the past week, and this brought a large range of stocks upon the market, the transactions aggregating a marked increase, as compared with recent sales. The late very favorable developments from the seventh station of the Gould & Curry mine, more fully noted below, have given great encouragement to those more immediately interested in this class of securities, and if successful in discovering a large body of ore, will prove of great benefit to the Pacific Coast. The developments from the Hale & Norcross ground toward the Savage will, most likely, give an impetus to the stock of the latter. Altogether, the outlook in behalf of the Comstock stocks is more favorable.

Chollar-Potosi — has been in considerable request, selling at a smart advance. For the week closing on the 25th ult., 1,220 tons of ore were extracted against 1,013 tons the previous week. An improvement is noticeable in the quality of the ore, and the old stope is more promising than last week. In that portion of the mine through which the branch of the Potosi Tunnel is being driven, known as the Grass Valley section, the prospects are reported to be highly encouraging, and good ore has been met with. Fifty-four feet have been added to the length of the west drift from the Chollar-Potosi shaft, making it 244 feet from the station. At latest dates, the ground in this drift was softer, and more rapid progress was made.

Belcher—ruled about the same as during the previous week. Up to the 26th of February, they had sent 795½ tons of ore to the Rhode Island mill, and on the 28th, they forwarded $12,000 in bullion to the office in this city. This mine is said to continue yielding well from the stopes on the 152 level. They are making good progress in cleaning out the 730 level, and will soon commence work in the face of the drift.

Gould & Curry — is in very active request at a rapid advance, as will be seen by reference to our list of sales. During the week ending February 28th, 263½ tons of ore were extracted; previous week, 189¾ tons—ore samples showing an average assay value of $46 52 per ton. At the seventh station, the drift running north is 400 feet in length, and carries heavy clay as the work extends north. The northwest drift, No. 2, is eighty feet in length, has passed through the first east clay, and is now in the porphyry that intervenes between the first clay and the quartz; they will have to run about sixty feet to reach the quartz. The ore reached by drift from the North Potosi shaft, on the 20th floor, so far as prospected, is reported to look more promising than was anticipated, and some time will be required to open it so that it can be worked to advantage. The sections in the old mine show encouraging features, and during the present week they expected to fairly start taking ore from the El Dorado tunnel.

Hale & Norcross—was in the market to a moderate extent, under a steady advance. The yield of ore for the week ending February 26th, amounted to 1,002¼ tons, against 1001¾ tons extracted the previous week. On hand, 6,710½ tons, of which 2,485 tons is low grade. On the 26th February, $25,032 in bullion was sent forward to this city. They are continuing the sinking of the shaft as fast as possible, and they expect to intercept the vein during the present week. On the sixth level, they are driving the north breast forward to the northern boundary—the Savage line. The ore vein here is now nearly its former width, and is said to be of a good quality. The ore breasts throughout this level are looking well, and this is the case with the breasts in the upper mine. The east drift on the 535 level has penetrated the vein, the ore being of good quality, and about twenty feet wide. The annual meeting of this company takes place on the 9th inst.——Segregated Belcher levied an assessment of $2 per share on the 2d inst.—*Commercial Herald.*

The Commissioners of Emigration of New York reports the number of aliens landed at that port in 1869 as greater than any year since 1854. The total number of passengers landed was 307,454, of which 259,989 were aliens. Of these, 99,605 were Germans; 66,204 were Irish; and 41,090 English, leaving 52,050 to all other countries.

The Gold Field of Nova Scotia.—The total gold yield of the mines of Nova Scotia, from the date of the first discovery of the precious metals there to the close of 1868, has been $2,560,000.

Farming and Gardening.

COMMUNICATIONS for this department are solicited from all parts of the Pacific States and Territories.

The Care and Treatment of Animals.

This is a matter of very great importance, and one that fully calls into action whatever of humanity one may chance to possess. The annoyance and abuse that many work-animals have to undergo, is a burning shame, and a damage too. Constant worrying and annoyance will make an animal poor, when with kind, consistent, and systematic treatment, more work might be accomplished upon the same amount of feed and with greater ease. Animals that work hard should be liberally and regularly fed. System is of great importance in feeding and treating any kind of live stock; and a liberal, regular system is the best.

It is unmerciful, besides being poor economy, to let animals suffer exposure to cold storms, without shelter from rain or winds, and to go hungry, withal, for want of feed, when an abundance that might have been easily saved was allowed to waste in the fields, or worse, perhaps, was burned as worthless straw.

It better accords with our feelings to note improvements that enterprising and humane men are making, than to upbraid the improvidence and wrongs so prevalent and glaring. But one is sometimes compelled to draw contrasts not at all pleasing to view.

Economy is needed in California in a thousand things which are impossible to enumerate here. *Enterprise* is not so much lacking as is *economy*. Our farmers all strive to get the best machinery, take pride in blooded stock, and put in immense crops; but "the crack in the trough leaks out the swill, and the pigs won't fatten." True economy takes care of little things; little moments of time, little opportunities for improvement; it prevents useless waste, and treasures every useful and every good thing. Meanness is not economy.

Economy is generous. It uses things to the best advantage for the welfare and happiness of all. It gleans and saves what might be lost in material wealth, in physical health, in mental and moral worth. *Intelligence is the soul of economy.* Franklin sought wisdom for economy's sake—gleaned it little by little from the hard fields of humble life, treasured it with studious care, and sowed it with a generous hand to his immortal fame. His example is as imperishable as is his fame; and while man depends upon the industries of the world, it will ever serve to guide him. H.

THE ANGORA GOAT.—A very interesting communication will be found in another column urging the more general introduction of the Angora or Cashmere goat into this State. The goat is one of the earliest animals domesticated by man, and is almost as cosmopolitan as the dog. He is found in every variety of climate, from the snows of Norway and Siberia to the burning sands of Africa. But of all the varieties known, the Angora produces the finest and softest wool, while its carcass furnishes a meat equal, if not superior, to the most approved mutton sheep. The advantages of goat raising are not fully understood on this coast. Much information in that direction may be obtained from the letter of our correspondent; and we propose giving additional facts from time to time as occasion and opportunity presents.

INCREASE OF VINEYARDS.—There will be a large increase in the breadth of our vineyards during the present season. It is estimated that 4,000 additional acres will be set out in Napa county alone. One grape-grower there—Mr. Schram—will increase his stock of vines from 18,000 to 0,000.

Cultivation of the Castor-Oil Bean.

Several correspondents have recently made inquiry with regard to the cultivation of the castor-oil bean in this country. In reply, we would state that the principal localities where this plant is cultivated, west of the Rocky mountains, are Illinois, Kentucky, Missouri and Texas; but it is grown as an ornamental plant in nearly every State in the Union. It seems a little strange that at a time when capital, in this State, is stimulating so many new enterprises, and when so much is being said of the advantages of "diversified culture," so little attention should be directed to the culture of the castor-oil bean here, and the manufacture of its oil. Enough has been done with the plant in California to fully prove that the soil and climate here is much better suited to the growth of the plant than in any of the Mississippi States, where its cultivation has been introduced. It has been fully tried, we believe, in Los Angeles, Santa Clara, Alameda, Yuba and Sutter counties. Some four or five hundred acres are in cultivation in the two last named, about 200 of which are owned by Dr. McDaniels, who resides some three miles below Yuba City, and nearly 200 more by Mr. C. Hodges. The Doctor has a mill upon his place, where he expresses and manufactures the oil. We believe there is also a small mill in Santa Clara county. The mill in this city is well known throughout the State, and is ready to purchase, at fair rates, all the beans that are likely to be raised for the present.

Method of Cultivation.

The castor bean is cultivated very much like corn, and requires about the same amount of labor. The time for planting is during the month of April—depending something on the season and locality.

A light sandy soil is best suited to the crop. It is not necessary that it should be rich or highly manured. In fact, it is claimed that the growth of two or three successive crops of beans, and a careful return to the earth, in the form of manure of the pods, leaves and stalks, will bring up to good condition, lands that have been exhausted by other crops; as this plant gathers most of its nourishment from the atmosphere, and very little is taken away from the field in the fruit. The following simple directions are all that is needed for its culture:

Plant, about the first of April, three seeds in a hill; lay off the ground in hills six feet apart in each direction, as the plant grows high and bushy. Between every eighth and ninth row, one way, a space of eight or nine, instead of six feet, should be left to allow of the passage of a wagon in gathering the crops, as hereinafter shown. When the plant is about four inches high, take away all but one—leaving the most vigorous; cultivate the same as corn, keeping the ground clear of weeds. When the stalks are one foot high they will outgrow any weed. The yield is from 1,500 to 2,000 pounds to the acre. Before planting it is well to soak the beans in water from fifteen to twenty hours. The seed should be placed in a suitable vessel, and the water poured over them, about as warm as the hand will bear.

Mode of Gathering and Shelling the Beans.

The beans grow in pods, arranged in spike-shaped bunches, about eighteen inches long, and should be gathered as soon as the pods begin to turn from a red to a greenish-brown color. The beans will begin to ripen during the month of August, and picking will be continuous for two months or more. The great drawback to the crop is the care and labor required in gathering it, as the ground has to be passed over, and every plant examined a great number of times. If the pods are not gathered as fast as they begin to turn they will burst of themselves and scatter the seed upon the ground, where it will be lost. They do not open gradually, but with a sudden "pop," which often throws the beans to a distance of ten feet.

In order to secure the seed and save waste, the pods are picked just before they are ready to burst—the time for gathering being readily determined by its color. In gathering, a wagon is drawn along through each of the *eight-foot passage-ways*, and pickers look over the four rows upon either side, picking off all the clusters or spikes which are of the proper color, depositing them in the wagon, to be drawn to a drying platform or house. Each spike contains from fifty to one hundred pods or capsules, and each capsule three beans. In the Atlantic States, houses must be employed on account of the frequent rains; here, an open platform is all that is needed. This platform may have either a ground or plank floor, and is better to be slightly sloping; if ground, the surface should be carefully cleaned, smoothed and rolled hard, as for a brick kiln, and should be perfectly dry.

The pods, as they are gathered, are spread thinly over a portion of the floor, and stirred occasionally with a rake. In four or five days after deposit the pods will all have been opened by the heat of the sun, the beans being thrown or popped out. Being heavy and small they will work their way to the bottom, so that the pods can be easily raked off, leaving the beans to be easily gathered up. The beans should be kept perfectly dry, and, after being run through a fanning mill, or by some other means divested of the small quantity of fine chaff, which may be gathered up with them, are ready for the market or mill. In the height of the picking season the field should be passed over by the pickers as often as every other day.

In laying out the platform, care should be taken to have it sufficiently large as to leave at least twelve or fifteen feet all around it, unoccupied by pods, or in popping out, the beans will be thrown off from the same and scattered or lost.

What is considered a fair crop in Southern Illinois is from sixteen to twenty bushels to the acre; in the northern part of the State, ten to twelve is considered good. In Texas, it is said that forty and even fifty bushels is sometimes realized. The reported yield in this State is from 30 to 45 bushels. The beans weigh 46 pounds to the bushel.

In the Mississippi States, the castor bean has to be planted every year. In India, it becomes a tree, growing on from year to year, attaining a height of thirty or forty feet, and bearing in wonderful profusion. The same, to a greater or less extent, is true of the plant in Texas, and in the southern part of this State. In the Sacramento valley we have seen individual plants, two or three years old, and fifteen or twenty feet high; but we are not advised whether the practice in field culture is to plant every year or not.

The cheapest kind of labor may be employed—Chinese or other; and it is only by such labor that the business can be made profitable in this State, at present prices.

With cheap labor there would no doubt be a fair market in this State and for export to New York, to the extent of perhaps half a million of dollars annually. The total amount of castor oil imported into the United States in 1857 was only $102,000 in value. The duty on castor oil is one dollar per pound, or at least was ten years ago—higher than upon any other kind of oil.

COFFEE CULTURE.—The Los Angeles correspondent of the *Bulletin* says that experiments are to be made there, the coming season, in the culture of coffee—seed having been received from the Sandwich Islands. An experiment in sorghum culture is also in progress there.

Take Care of the Tools.

Although it is admitted that our farmers, who were such at the East, have much to learn as to the methods of culture best adapted to the various and special soils and climatic conditions on this coast; yet it appears unnecessary that they should forget or ignore the economy they learned to practice in a less fruitful and more rigorous region. It is to be regretted that so many of our farmers here fall into habits of shiftlessness that would result in utter failure and poverty in the East; habits that engender evils, which increase expenses, waste precious time, and occasion much annoyance; habits of improvidence that often result in great suffering and even loss of life to domestic animals.

When we observe the amount of expensive agricultural machinery and implements that the farmer requires in his numerous branches of labor, it is painful to notice what a small proportion of the same is properly taken care of and housed from the effects of rain and sun. What with the shrinking and swelling and warping and rusting, must be the year's loss in these things to the negligent farmer on this coast? Let every farmer seriously regard this question, and consider whether it is worth his while to take care of his own.

Did you ever pick up a shovel or a hoe that had been carelessly thrown down where it was last used, the dirt adhering to and rusted to it, and notice how much harder you had to labor to accomplish the same work than with a tool kept clean and bright? Did you ever get annoyed by spending ten or fifteen minutes in looking for an instrument that had been thrown carelessly down somewhere, when less than five minutes would have sufficed to clean it and put it away? And that mowing machine or reaper which would not have required over two hours to pack nicely away under shelter, and not any longer to have got ready for use; what a time you had with it! It took two men, all day, to clean off the rust and get it together, and then it had to be taken to the blacksmith shop to get things righted—nuts missing, a few new bolts needed—besides braces to strengthen, etc. Two whole days lost, besides other expenses, before the "old machine" is ready to run! Then with careless handling and neglect to keep it properly oiled, the boxing is soon worn out, and the "old rattle-trap" is thrown aside, or made to do poor service at an extra draft on team, and time, and patience.

These remarks might be greatly extended; but a hint is often as good as a sermon to the well-meaning farmer, while any amount of sound reasoning would not cure one afflicted with chronic habits of incorrigible shiftlessness.

The old adage, "have a place for everything, and keep everything in its place," is real economy, in any light it may be viewed. A proper place s a convenient one where everything is arranged and kept in order. H.

THE JAPANESE COLONY IN EL DORADO, under the excellent management of Herr Schnell, is beginning to look like business. Mr. S. has just received, in excellent condition, and is having them set out as fast as possible, 140,000 of the tea plant. He expects to have at least five chests of tea on exhibition at the next State Fair, of this year's growth, from the plant set out last year. The picking of the tea is done during the month of June, therefore the plant requires but little irrigation. Mr. S. has also received from Japan the famous "wax tree," from which the gum used by Japanese in lacquering fine ware and cabinet work is obtained. The tree looks very much like a young fig tree; although but just received and set out, yet they are starting nicely. He also has a new kind of silk-worm peculiar to Japan, called "Aman," which feeds on black oak leaves. The egg has the appearance of coarse black onion seed, and the worm is much larger and of a brighter color than the ordinary silk-worm. We were shown by Mr. S. a sample of silk manufactured from this species, and for fineness and brilliancy of texture it was certainly superior to any we ever saw before.—*Mountain Democrat*.

Facts About Honey.

Whether bees *make* or simply *gather* honey, seems to be yet a disputed point. There are writers who assert that the nectar of the flowers gathered by the bee is simply a portion of its food or drink, and that the honey deposited in the cells comes from the honey-secreting glands, which are analogous to the milk-secreting glands of animals;—that the honey-bag of the bee performs the same office as does the udder of the cow. In other words, that bees *make* their honey. Such writers argue that if it were not so, when a bee gathers molasses it would deposit molasses, etc.; while the fact is that the various kinds of material upon which the bee works simply modifies the character of the honey.

There are others who reason quite differently—who assert that the bee simply *gathers* honey formed by Nature in the flowers. Such persons attribute the difference which is observed in honey to the fact that every kind of power secretes a mellific substance peculiar to itself, partaking, to a greater or less extent, of the properties of the plant upon which it is found. Hence, some kinds of honey are very obnoxious—others even poisonous. In some localities, people think it is not safe to eat honey at all until after it has been boiled; a process which is thought to evaporate the poisonous qualities. When "doctors" so disagree, it might be considered presumptuous for even the Scientific Press to decide. So we leave this matter still an open question.

We believe, however, it is generally agreed that bees never mix the different kinds of honey when depositing them in the hive. If they commence to work on white clover (which makes the best honey) so long as that kind of "feed" can be obtained, they will work on nothing else; and all the white clover is deposited in cells by itself. When they leave that for buckwheat, or any other food, they commence depositing in adjoining cells, or on a separate piece of comb.

Experienced bee-keepers, who are aware of this instinct, often remove the combs which are filled during the continuance of the clover; because after the cells are all filled it is difficult to distinguish this from any other. Exhibitors of honey at fairs not unfrequently take advantage of this to secure a choice white article with which to secure the highest prize, when the balance or average of the stock would be quite inferior.

How to Judge the Quality of Honey.

This is an interesting question, and one, we believe, not very generally understood. Honey, of course, is judged *mainly* by its color; but owing to the fact that there is often a very great difference in the color of the comb, and the additional fact that bees often put white honey in dark combs and *vice versa*, it is manifest that very great care must be exercised in taking into account both the comb and the honey. The proper way to judge honey is to strain it into glass jars. You can then readily judge of its color. But then there are at least two other qualities to be considered—thickness and flavor. In judging of its thickness, it is necessary for the judge to know whether that quality was imparted in the first instance, or whether it is due to the action of light; for light (the chemical rays) acts upon honey very much as it does upon the iodide of silver, on the photographers' excited collodion plate.

Take two bottles of honey from the same comb, seal them up perfectly tight, and keep them both at the same temperature—only one in the sunlight and the other in a dark room, and the former will gradually grow thick and finally assume a semi-crystalline shape, while the other will retain its original fluidity. This is one reason why bees always work in the dark, and why honey should also be kept in the dark or in opaque vessels.

It would be very improper to award a first prize to a jar of honey that had become thickened by the action of light, because it thereby becomes deteriorated. Still, honey, to be superior, should not be very thin. Flavor is also a very important consideration, and must always be required. A good flavored, dark honey may sometimes be superior to a white article which *looks* much better. The thickness and thinness of honey depends upon the source from which it is gathered, rather than upon the secretive action of the bee, whether we admit that the insect *makes* or simply *gathers* it.

What I Know of Farming.—No. 7.

Trees—Wood-Land—Forests.

We condense as follows: I am not at all sentimental—much less spooney—regarding the destruction of trees. I realize that trees exist for use rather than for ornament, and have no more scruple as to cutting timber in a forest than as to cutting grass in a meadow. Utility is the reason and end of all vegetable growth—of a hickory's no less than a cornstalk's.

Yet I am not insensible to the beauty and grace lent by woods and groves to the landscape they diversify. A homestead embowered in stately, graceful elms, maples, and evergreens, is really *worth* more, and will sell for more, than if it were naked field and meadow. It is one positive advantage (to balance many disadvantages) of our rocky, hilly, rugged Eastern country, that it will never, in all probability, be so denuded of forests as the rich prairies of the Great Valley may be. Our winds are less piercing, our tornadoes less destructive, than those of the Great West. The Yankee, who has been accustomed to see trees spring up spontaneously wherever they were not kept down by ox or plow or scythe, and to cross running water every half mile of a summer day's journey, may well be made homesick, by 2,000 miles of naked, dusty, wind-swept plains, whereon he finds no water for fifty to a hundred miles, and knows it impossible to cut an ax-helve, much more an axle-tree, in the course of a wearying journey.

All over the "Plains" there is evidence that trees grew and flourished where none are now found, and that springs and streams were then frequent and abiding where none now exist. And I have heard that, since the Mormons have planted trees over considerable sections of Utah, rains in summer are no longer rare.

I have firm faith that all the great deserts of the Temperate and Torrid Zones will yet be reclaimed by irrigation and tree-planting.

One who has a hundred acres of good soil, whereof twenty or thirty are wooded, cuts off his timber entirely, calculating that the additional grass that he may grow in its stead will pay for all the coal he needs for fuel, so that he will make a net gain of the time he has hitherto devoted each winter to cutting and hauling wood. He does not consider how much his soil will lose in summer moisture, how his springs and runnels will be dried up, nor how the sweep of harsh winds will be intensified, by baring his hill-tops and ravines to sun and breeze so utterly. In my deliberate judgment, a farm of one hundred acres will yield *more* feed, with far greater uniformity of product from year to year, if twenty acres of its ridge-crests, ravine-sides, and rocky pieces, are thickly covered with timber, than if it be swept clean of trees and all devoted to grass.

Spain, Italy, and portions of France, are now suffering from the improvidence that devoured their forests, leaving the future to take care of itself. I presume the great empires of antiquity suffered from the same folly, though to a much greater extent. The remains of now extinct races who formerly peopled and tilled the central valleys of this continent, and especially the Territory of Arizona, probably bear witness to a similar recklessness.

Mr. Greeley concludes as follows: I entreat our farmers not to preserve every tree, good, bad, or indifferent, that may happen to be growing on their hands—but, outside of the limited districts wherein the primitive forest must still be cut away in order that land may be obtained for cultivation, to *plant and rear at least two better trees for every one they may be impelled to cut down.* How this may, in the average, be most judiciously done, I will try to indicate in my next.

Mulberry Trees.—It is estimated that there are 500,000 mulberry trees growing in Southern California.

The Angora Goat—Its Value to California.

[Written for the Scientific Press.]

Editors Press:—I noticed an article in a late number of the Tulnre *Times*, copied from your paper, on the subject of Angora goats, from which I perceive you feel an interest in such matters, and hence take the liberty to furnish your readers with the following additional facts:

Early Importations.

I have spent nine years in the business, trying to give this breed of goats a full and fair test on this coast. I made the first importation here in 1861, and bred them five years before there was any other importation of pure breeds. I then imported eight more, and have made one other importation since. I have purchased and brought to this coast the first choice of nearly one-half the goats ever imported to America, and have experimented upon them in almost every way.

Their Success in California.

I pronounce them, without reserve, a perfect success in California, and am prepared to prove to any man who feels enough interest in the subject to investigate it, that we can not only compete with Asia Minor, but that we have already *improved the original stock*, by judicious breeding and the aid of a climate which has proved to be the counterpart of the place of their nativity.

I sheared a buck last year, which was the eighth generation from the original Davis importation of 1849. He yielded seven pounds of clean, fine, lustrous fleece, entirely free from kimp or hair. I have *read* of heavier fleeces, but have found no imported goat to exceed it, either in quantity or quality. I can show "grade goats," bred up from the common Spanish goat and the finest Angora bucks, that far surpass in all points any but the very finest of the imported Angoras; and I defy an expert to detect their being grades by their looks.

Leading Questions Asked Daily.

First. Do they furnish good meat for the table? A committee which was chosen the other day, near Gilroy, to eat of the meat and give an impartial decision of its quality, after having partaken of the goat and the sheep, both barbecued and roasted,—they not knowing which was goat or sheep,—and neither knowing how the others voted, gave a handsome majority in favor of the goat meat. Mr. Sargent furnished the Cashmere goat, and Mr. Reynolds the sheep. [We gave a particular account of this novel dinner party in the Press two weeks ago.—Eds. Press.]

I will give another evidence of their value for food: I sold my Angora wethers last fall to a butcher in San Juan South, at eight cents per pound, he taking all I had, and returning the pelts, which I sold in Gilroy for an average of $2 each. Mutton sheep sold at the same time and place for eight cents, and the pelts retained, making a net premium of $2 per head on the goats; besides, the goats breed one-third faster and weigh more at the same age. In eight years breeding, the lowest percentage of kids I have ever raised was 155, and the highest 192; while 125 is the highest on sheep, and from that down to eighty.

Goats Better than Sheep in Drougth, Etc.

I have ranged two bands of 1,500 each, of sheep and goats, this year, on the same range, where it has been excessively dry. The result was, it took three men to herd the sheep, while one man herded the goats with ease, losing but six, while of the sheep I lost 150 head! Hence the advantage the goat has over sheep during a dry season. My sheep did better than my neighbors, being mostly of the Southdown varieties. We are often asked,

What Can You do with the Fleece?

Banendahl & Co., Nos. 3, 5 and 7 White street, near West Broadway, New York, is a good firm to handle it. They sold last year all they could get, at from 75 cents to $1.25 per pound, for manufacturing purposes, and imported from Asia Minor over 20,000 pounds at a cost of 80 to 1.12 per pound. There are now five or six factories that have worked the fleece, which I could mention, but suffice it to give one—the Wntersides Mills, of New York. This company imported in 1868 $70,000, gold value, of machinery designed especially for working goat's fleece. The enterprise has proven a perfect success, fully competing with Europe. The only difficulty is to raise the fleece to keep their machinery running.

Goods Manufactured from the Angora Fleece.

There are over fifty different varieties of goods imported into the United States made of the Angora fleece. It does not seem to be generally understood that all our mohair goods, mozambique and water-glaze, all-goats hair, Cashmere and many other styles of goods, in almost every lady's wardrobe, are made from the Angora goat's fleece; but such is the fact, and we import immense quantities of those and other styles of goods made from this fleece, and pay very high duties to get them. There are nine factories in England that work about 2,500,000 pounds per annum, and the United States consumes a liberal portion of the goods manufactured by them.

When I first introduced the Angoras on this coast, I met with much opposition in the way of ridicule; hence the extreme pleasure it gives me to know that it is no longer an experiment; that it has overcome all opposition; and a man now does not have to leave home to get all the proofs and a market for his meat or fleece, at a good remunerative price. I might write twenty pages of facts and figures, but it is not necessary. Bauendahl & Co., or the Wetersides Mills, will answer all questions satisfactorily; or, if parties interested will visit my flock, I can show the imported goats from all parts of Asia Minor—both horned and hornless—and all the different cross breeds.

I have the only thoroughbred, hornless goat in the United States. Please allow me to say there is no danger of overdoing the business, since California, Georgia, and a small portion of France has proved to be the only localities where this beautiful and useful animal does well.

Wm. M. Landrum.

Wetsonville, Feb. 20th, 1870.

Noxious Insects—Something for Californians to Think of.—Fully one-half or more of the insects most injurious to vegetation, which infest American fields, were imported from Europe. The Hessian fly came over ninety years ago, with the hirelings of that name with whom England sought to perpetuate her power within our present domain; the wheat midge also came from Europe about forty years ago, and the bee-moth a little earlier, the Currant-fly *(Trochilium tipuliforme)* and the meal worm all found their way hither at different periods across the Atlantic. The asparagus beetle and the gooseberry saw-fly are both very recent importations—the latter, which has made its appearance only within the decade just closed, has already proved very destructive in some parts of the Eastern States. The cockroach, though generally written with the prefix "American," is thought not to be indigenous, but really an importation from Asia. Many others, not so generally known, and less destructive, might be enumerated.

For all this injury inflicted on Americans by European insects, we have reciprocated only to a very slight extent. The chief insects for which our trans-Atlantic friends have to credit us, are the pea-weevil and the house ant.

Californians have as yet suffered but little from insect pests; and a little intelligent care will save us yet for many years from such trouble. The curculio, the apple-worm, and numerous other like troublesome pests are as yet unknown here, and so long as Eastern fruit is kept out of this market, their march hither will be very slow—keeping pace only with continuous settlements across the plains. Their first appearance should be carefully watched for, and the pioneers summarily and industriously disposed of.

Cotton Seed.—Eighty tons of cotton seed arrived at this port on Wednesday of last week. A portion of this seed will be sown in the southern part of California.

Notices to Correspondents.

W. T. R., Leviathan Mine, Monitor.—We had intended publishing your spicy letter, but have so much matter on hand that it will be impossible for some time; and as it is founded on a misapprehension of our ideas, we prefer to answer it here. In the first place, our remarks were general, and were called out in part by other letters and remarks. Then, as to the reaction of CuO, SO_3 and CaO, CO_2, the only question was as to what took place *in the pans*. The reaction of the two *alone* proves nothing; and that, in the pans, the limestone *only* is the active reagent on the sulphate of copper, and that, consequently, carbonate of copper is the form to which all the sulphate is changed, is probably more than you wish to state. Your haste led you to color up other parts of our remarks in rather an unfair manner.

Anson Burlingame.—The death of this eminent man is announced as having occurred on the 23d of February, 1870, at the capital of Russia. Mr. Burlingame has long held a high position in the country, and during his Congressional career always commanded the respect of every one by his bold and manly stand on all questions which concerned, in his opinion, the immediate welfare of the country. He attained a still more prominent position in the world when he became Envoy-Extraordinary of the Chinese Government to the United States and to Europe. His death occurred in his forty-eighth year.

* * *

The Burleigh Drill was tried on Tuesday, Wednesday and Thursday of this week, at the India rice mill, corner Main and Mission streets. On Wednesday there was some difficulty, which, however, we have never before witnessed, and we have seen the machine at work in various places. On Tuesday and Thursday satisfactory results were accomplished, and on the last day a hole one and a half inches in diameter and 25 inches deep was drilled in hard Rocklin granite in eight minutes.

* * *

Evaporation of ammonia is said to be the best method of producing artificial ice, and a German machine has been constructed capable of turning out, by this means, with the aid of three men and a horse-power engine, a thousand pounds of ice an hour.

Our Water Supply—A New Plan.

The discussion of the water question is occupying a considerable share of public attention. It is right in such a case that the people should be informed on the different points involved, and the whole matter thoroughly ventilated before any decisive steps are taken. One project has been brought prominently forward and urged by high engineering ability—the Lake Tahoe project. That water *can* be brought according to this plan, we believe, but the grand difficulty is with regard to the expense, and perhaps the right to tapping a lake lying partly in another State.

The first draught of a new plan for supplying the city with water has been shown us, which at first sight, at least seems feasible. It is proposed by Mr. W. B. Clark, of Calaveras county, who has been engaged in hydraulic engineering for many years. The general outline of his plan is as follows:

First—Up in Alpine county are three large lakes of good water, which hold a large supply—enough, it is calculated, to furnish eighty million gallons daily for a year, should, in the meantime, not a drop of water flow into them. These lakes, however, are only to be used as a reserve supply in the driest seasons. Very probably there never will be any necessity for them. It is well, however, to have them in case of unexpected emergency.

Second—It is proposed to build a canal from the north fork of the Mokelumne river down to Spring Valley, a distance of some thirty miles in an air line. This canal will be fed, moreover, from the other forks of the river, so as to have a sufficient supply. The originator of the plan has measured the amounts of available water during the last ten years, and has found them amply sufficient, with the exception, perhaps, of the last year, which was an unusually dry season. The reservoir at Rich Gulch, near the commencement of the canal, will have an altitude of about 2,500 feet; that at Spring Valley, some six miles below Mokelumne Hill, of about 1,200 feet.

Third—From the reservoir at Spring Valley, a pipe is to be laid to Livermore Pass (500 feet high) and thence down to the narrow part of San Francisco bay, near Alameda creek, across the bay and up to the city. This pipe can easily be laid with a capacity of furnishing the city with 20,000,000 gallons daily. A branch pipe can run up on the other side of the bay to Oakland, if desired. The whole distance for the pipe is ninety miles, measured in a horizontal line.

By this plan, it is claimed, a large supply of excellent water can be provided for the city at a comparatively moderate expense. As before stated, Mr. Clark's measurements of the amounts of water obtainable from the forks of the Mokelumne are amply sufficient for ordinary times, and there are the lakes to fall back upon. The quality of the water is excellent. The streams will be tapped high up the mountains and above the mines, so that the water will be pure and good. There is no mining camp within fourteen miles of the proposed place of tapping. There is, moreover, no question as to the water rights. The lakes and streams are all within our boundaries, and locations for hydraulic purposes have been made, which render impossible any legal troubles. The water will be brought into the city under such a pressure that, indeed, it can be used in case of fire in place of the fire engines.

In regard to the cost, it is claimed that the work can be done for five or six millions of dollars, and that parties can be found who will undertake the job for this sum.

It is Mr. Clark's intention to lay before the public complete maps and drawings relating to the work. When this is done we shall be able to judge more fully with regard to the project, to which we now make preliminary reference. If we must bring water for the city from a distance, it is well to know all the available sources of supply. This route is shorter than that of the Lake Tahoe Company, and appears to present no difficult engineering problems, such as tunneling, etc. A part of the way, up in the mountains, the way is already marked out, having been commenced for hydraulic purposes, and it was the present discussion of the water question which brought Mr. Clark down, to work actively in the prosecution of a plan which he has meditated, he says, during the past ten years.

Our present water supply, all agree, is not sufficient. Some state that it can be made so, however, without going so far away for it. It is an important question whether the quality of the water will be such as it ought to be, if taken from the Peninsula. Water taken from cultivated land is very *apt*, to say the least, to be very impure, for obvious reasons. Moreover, by taking every drop of available water for the city, we are giving just cause for complaint to the farmers, who have none too much water, when enjoying undisturbed rights to the streams. By the project we here give, not only will the city get an abundance of excellent water, but the advantages to the mining countries along the route can be made immense.

* * *

Combined Drill, Reamer and Tap.

This ingenious device is intended to combine in one operation several distinct objects. It is an exceedingly simple device, and, at the same time, appears to be a most efficient instrument. It consists of a drill, of a reamer, and of a tap, all combined in one piece. Its object is to provide a tool which will drill, ream and cut a screw in gas or water pipes in one operation, and thus economize in time, while it likewise avoids the annoyances experienced where different tools are used one after another. The slots of the tap are filled with tallow, soap or clay, when in use, in order to prevent the escape of gas during the operation, and at the same time to facilitate the action of the tool. It was invented by William Humphrey, of Waterford, New York, who claims the following advantages: 1st. There is a less cost of tools. 2d. A less number of tools to be used. 3d. A saving of time. 4th. Less loss of gas and the avoidance of the ensuing annoyances. 5th. It does the work better than other instruments, and cuts a cleaner and fuller thread, as there is no chipping to be done. These advantages will attract the attention of mechanics in general, and in particular of those who fit gas and water pipes. The invention has been previously described in the *Gas-Light Journal*.

The Grand Musical Festival.—The total receipts of the festival have been given approximately as $46,000, and the expenses as between $20,000 and $22,000.

Our Home Industries.

Shipping, Crushing, Sampling and Selling Ores.

Two weeks ago we published a general article on this subject. We now give the following, written by one familiar with the business, in this city, who gives a more specific account of the routine through which the principal portion of the precious ores sold on this coast pass through:

Till of late, the prospecting miner who was fortunate enough to strike a rich lode, if prevented by poverty from developing it, was compelled to dispose of it, either in part or altogether, to parties able to command the means to work it. In the former case, he was often frozen out by assessments, which amounted to nearly the same thing as selling out entirely, so far as his interests were concerned. The value, or rather the no value, of what were termed *indications*, was, after a while, pretty well understood. The whole business was speculative. A very few made "lucky sales" of what proved to be worthless claims, but, as a rule, those valuable were sacrificed for a trifle, and in this case the *bona fide* miner and prospector went to the wall and had the satisfaction of seeing others enriched by his discoveries. The assays were from the hap-hazard system followed, frequently incorrect, and in many instances, being from picked samples, afforded no criterion to the richness of the ledge.

The Plan now Adopted.

The miner now-a-days who makes a good strike, and can take out with trifling labor a few tons (sometimes only a single ton) of good ore, has only to send it in stout sacks, properly marked, and each containing about one hundred pounds, to a commission ore merchant in San Francisco. The freight by the railroad is very moderate, being only $14 per ton from Elko. In about a week or less he will receive the money for which his ore has been sold.

Prices Paid for Ores.

The prices paid in this city for ores are about from 56 per cent. on the assay value of ores assaying $100 per ton, to 80 per cent. for ores assaying $600 per ton, and upwards, the percentage increasing with the value of the ore. The ton of silver ore is 2,000 pounds avoirdupois.

Copper ore is purchased by the unit, which varies with the ore. For ore containing 20 per cent. of copper, the price is about $50 per ton of 2,352 pounds avoirdupois, proportionably larger prices for richer ores, and for those showing a percentage of silver. Copper ore is assayed by the humid method, from which a deduction is made to equalize it with the fire assay—21 3-10 per cent. by humid assay being equivalent to 20 per cent. by fire assay, which latter percentage determines the market price.

Commission Ore Agents.

The commission ore merchant or agents (say for instance, Mr. A. T. Green, No. 3 Front street, Mr. G. W. Stewart, or Mr. P. H. Kraner, all of whom are engaged in the business in San Francisco), on the receipt of a consignment of ore, has it taken immediately to the crushing and sampling works of Messrs. S. W. Howland & Co., where it is crushed and sampled in the most careful manner. The samples are sent in sealed bottles to *two different* assayers, as those of the San Francisco Assaying and Refining Works, Montgomery street, or of John Scott, 423 Mission street, or to Messrs. Hentsch & Berton's assay office, or others of equal ability. On the result of the assay of these gentlemen depends the price of the ore, the prices before mentioned being a close approximation. The money for which the ore is sold, is at once paid to the order of the owner. There is no delay, there being a constant and increasing demand for silver ores assaying $100 per ton and upwards, and for copper ores containing 20 per cent. of copper and upwards, by merchants and others in San Francisco, for shipment to the Atlantic States and Europe. Amongst the purchasers may be named Messrs. Cross & Co., Messrs. Moore & Co., and Prof. Thomas Price.

Benefit to the Miner.

To the miner in want of funds to carry on his work, the advantages of this system are apparent. By from time to time forwarding ore to this city, he is enabled to realize at once a liberal percentage upon its assay value. Over fifty tons was crushed and sampled in one week recently by Messrs. Howland & Co., which sold for from $100 to $400 per ton.

Crushing and Sampling.

As on the accuracy of the sample to be assayed so much depends, proper attention to the crushing and sampling is of the utmost consequence. The convenient and spacious works of Messrs. S. W. Howland & Co., 413 Mission street, opposite to the Union Foundry, are especially adapted to the purpose, and are kept constantly employed in operating on ores from the country for sale. The means used for obtaining accurate samples of each particular lot are most perfect, and the strict attention paid by Mr. Howland and his partner, Mr. J. W. Thurman, to the careful execution of their orders, has established their reliability. They have consequently obtained a large run of custom, which, from their personal superintendence of the minutest details of their work, they are deserving of.

The ore on its arrival from the wharf is piled beside an immense crusher, which breaks it into smaller fragments. It is then passed through a large mill, resembling a coffee mill, and by this it is reduced to the size of fine gravel. After this is completed, it is mixed and intermixed in a most thorough manner by being spread out and turned over and over repeatedly. One-tenth part of the whole is now passed through a mill of Mr. Howland's own design, which pulverizes it. The pulverized ore being again spread out and turned over several times, about fifty pounds of it is taken and again mixed well in a similar manner. Finally, from this, very small quantities are taken from different parts of the pile, sufficient to fill three or four bottles, which are then sealed up, labelled, and sent direct to the assayers. From the thorough means used to intermix the ore, the result is, as has been demonstrated frequently, that the samples satisfactorily represent the quality of the whole. Each apparatus is swept clean after use, as are also the floors, before crushing another lot, so that it is impossible for the smallest particles of any two lots to get intermixed.

◆

Window Catch.—A very neat device was shown us the other day. It is W. A. Sublett's "Patent Ball Window Catch," which consists simply of a ball moving in an inclined chamber, and operated by a lever. It does away with all cords, pulleys and weights, is very easily attached, and is cheap. The sashes are easily fastened at any height, and it is claimed to be almost impossible to get the catch out of order. It is said to be extensively used on the Central Pacific Railroad, and certainly appears to be a great improvement in several respects on the old methods. A working model may be seen at Marsh, Pillsbury & Co's, corner of Pine and Front streets, San Francisco.

◆

The large steel works of Krupp at Essen, in Prussia, occupies 800 acres of ground, of which 200 acres are under roof. The establishment employs 8,000 workmen, besides 2,000 at the mines and furnaces. It contains 412 melting and cementing furnaces, 195 steam engines, 49 steam hammers, 110 smith fires, 318 lathes, 111 planers, 61 end lathes and planers, 84 boring machines, and 75 grinding machines. It has 13 miles of railway with six locomotives and 150 wagons. The gas works supply 10,000 to 11,000 lights. The daily consumption of coal is given as 225 tons. Mr. Krupp has refused a patent of nobility once or twice.

◆

For the Commission Business, there is requisite, besides mere business ability, also an extensive acquaintance with the wants of the country, and if to these urbanity of manners is added, so much the better. Mr. A. T. Green, No. 3 Front street, has resided some nineteen years in the State, and has a thorough knowledge of the country and of the people. His references are of the best. We recommend miners and others who desire to find a good agent or commission merchant to try him.

◆

A **Saving.**—Farmers and country dealers should examine the reaper and mower sections and knives manufactured by T. G. Durning & Co. in this city, as they guarantee to furnish an article equal to anything in this line of Eastern manufacture at a saving, it is said, of fifty per cent. on prices usually charged. Their advertisement will be found in this paper.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending February 15th.

Tool for Checking Timber.—Arthur W. Dorr, Lake Valley, Tahoe P. O., Cal.

Combination Padlock.—George K. Farrington, Alcatraz Island, Cal., assignor to himself and Frederick and Victor Schulz.

Buildings.—Jules Touillon, San Francisco.

Horizontal Wind-Wheel.—Jerome A. Vaughn, Downieville, Cal.

For the Week Ending February 22d.

Thorough-Brace.—James E. Requa, Sonora, Cal.

Wheelbarrow.—Henry Alter, Lakeport, Cal.

Needle for Sewing Machine.—John L. Boone, San Francisco.

Grip Pulley.—Andrew S. Hallidie, San Francisco.

Egg-Beater.—Frank Krandelt, San Francisco.

Roofing and Flooring.—P. N. Mackay, Virginia City, Nevada.

Fence.—Harris Harding Margeson, San Francisco.

Cultivator.—A. B. C. Nusbaum, Sacramento, Cal.

Boat-Detaching Apparatus.—John Ross, San Francisco.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

◆

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Improved Horizontal Windmill.—J. A. Vaughn, Downieville, Cal.—The object of this invention is to construct a horizontal windmill, in which the vanes are alternately opened and closed by the action of the wind as they turn. The device is decidedly novel, and consists of a circular box, to use simple language, in the sides of which are numerous doors opening outwards. Two opposite doors are connected by rods of such a length that when one door is closed the other must be open. The mill is made to revolve by the pressure of the wind against the inside faces of the open doors; but as these doors revolve on the mill, of course their backs, after a half revolution, are acted upon and they are closed. The opposite doors are thereby opened and acted upon by the wind, and thus the mill is kept constantly revolving.

This very ingenious device was invented by the editor of the *Mountain Messenger*, and we hope that his windmill and his paper may aid in keeping one another in extensive circulation. We cordially recommend both to the consideration of our readers, for they do more than merely revolve in the wind—they both *grind corn.*

Improved Sewing Machine Needle.—John L. Boone, San Francisco, Cal.—In our boyhood days we conceived the greatest respect for the old pioneer Daniel Boone, the narration of whose exploits filled our hearts with delight. We expect, however, that in the next generation this admiration of Daniel will yield in part, at least in the case of the girls, to one quite as rational for his namesake John L., for mothers will instruct their children how the latter's invention of a simple little device has saved hours of labor and repeated trials of patience. We have several similar needles in the market, but these are open to several objections, which it is claimed, are entirely obviated by the device, which furnishes a strong needle, and one that will not catch and tear the thread of the cloth. The Boone needle is split a short distance above the eye, downward in a direct line into the eye at one side; the split again commences at the lower end of the eye, passes downward toward the point, emerging on a curve at the bulge formed by the enlargement above the point, forming a closely fitting finger, which serves as a wall or support to that side of the needle. The point of the finger is sunk below the general surface of the needle, so that it does not interfere in any way when the needle is passing through the fabric. The threading of the needle is so simple that it can be performed in the dark. The needle has been easily run through ten and twelve thicknesses of unbleached and bleached muslin, acting in all respects as well as an ordinary needle. Testimonials are given from all the sewing machine companies in the city.

Improved Extension Bedstead.—F. Menzer, S. F.—This is a device for changing a single bed into a double one, or *vice versa*, to suit the circumstances. The head-boards and footboards are made of the ordinary width for single beds, but have supplemental boards, attached by hinges, so that they can be folded back, or opened. Instead of the slats usually employed, the bed bottom is formed of a series of frameworks, so constructed that they can be drawn out or closed up as desired. The mattress is made so that it can be folded together and form a mattress for a single bed, or opened out to fit the extended bed, either by constructing it in two parts and uniting these loosely, or by making it into one piece and leaving a folding crease through the middle. A bedstead or children's crib constructed in this manner can be extended at night, so as to accommodate more than one person, and folded up in the morning so as to occupy but half of the space. The cost of construction is said to be but little, if any, greater than that of an ordinary bedstead.

◆

Report of Samuel S. Fisher, Commissioner of Patents, for 1869.

Herewith we commence the publication of this report, dated January 27, 1870, which will be given nearly complete in continuous numbers of the Press. It is clear-sighted, interesting, and forcibly suggestive of many improvements in this department of our Government:

The receipts and expenditures for the year, and the condition of the balance in the treasury, standing to the credit of the patent fund at its close, are shown in the following statements:

Number of applications for patents during the year 1869		19,271
Number of patents issued, including reissues and designs		13,986
Number of applications for extensions of patents		153
Number of patents extended		108
Number of caveats filed during the year		3,624
Number of patents expired during the year		2,083
Number of patents allowed but not issued for want of final fee		997
Of the patents granted, there were to citizens of the United States	13,442	
Subjects of Great Britain	294	
Subjects of the French Empire	91	
Subjects of other foreign governments	159	
		13,986
Amount received for applications, caveats, etc		$632,700 65
Amount received for copies and for recording assignments		60,445 16
		$693,145 81
Cash paid for salaries and for miscellaneous and contingent expenses		$486,430 74
Amount to the credit of the patent fund January 1, 1869		$324,330 67
Excess of receipts over expenditures during the year 1869		206,715 07
Leaving a balance January 1st, 1870, of		$531,045 64

Business of the Office from 1837 to 1869,

1869...	19,271	3,624	13,986	693,145 81	485,430 78

It will thus be seen that, with average receipts and expenditures not greatly varying from those of the past year, the net income of the office will be about $200,000 per annum, and that there is now standing to the credit of the patent fund a balance of over $530,000.

This fact should be borne in mind in connection with any suggestions relating to increase of salaries, or facilities for performing the work of the office.

The Patent Office earns all the money which it expends, or proposes to expend; and as the inventors give, in the form of useful invention, quite as much as they receive by way of protection; as they are moreover, taxed as citizens, as manufacturers, and as vendors of their patents and inventions, it would seem to be unjust to tax them again, in the form of additional fees, for the support of the government of the payment of a national debt.

The patentee does not pay these fees as a compensation for the exclusive privilege which he receives. For that, he makes a full disclosure of his invention, for the future benefit of the nation. The fees are intended solely to pay the necessary expenses incurred in the examination of the invention and in the issue of the patents. In all other countries, the fund derived from the patent fees is applied to the advancement of science. The fees which are paid in this country are less than in any other, but if they are more than is needed for the expenses of the Patent Office, as at present organized, it is but fair, either that the fee should be reduced, or that the balance should be employed in such increase of the force of the office, or in providing such publications and appliances, as may increase the ease, thoroughness, and efficiency of the work of examination.

Inventions in Southern States.

One of the most gratifying results of the restoration of peace and of the introduction of a new system of labor in the South, is found in the increase of applications for patents from that part of the country. During the past year forty-six patents were granted to citizens of Alabama, eleven to those of Arkansas, five to Florida, sixty-eight to Georgia, eighty-six to Louisiana, fifty-three to Mississippi, forty-four to North Carolina, twenty-four to South Carolina, sixty-nine to Tennessee, forty-four to Texas, eighty-six to Virginia, and thirty-seven to West Virginia.

In the class of agriculture, the Examiner reports that "in 1859 the number of applications from the South, as compared with those from the North, was less than two and a half per cent. of the whole number. In 1869 the number of applications from the South was increased to over twenty-three per cent. of all the cases in my class."

What the Pacific Slope and the Great Basin are doing in the way of invention may be inferred from the fact that in 1869 there were granted two hundred and sixty-six patents to California, thirty-nine to Oregon, four to Nevada, two to Washington, ten to Colorado, three to Dakota, one to Idaho, one to Montana, and two to Utah.

[to be continued.]

◆

The Spirit of the Age.—The following is from an article in the *U. S. Railroad Register*: "Two new scientific magazines have just appeared in London; one called the *Academy*, the other, *Nature*. They illustrate the change which is rapidly taking place in the civilized world. As old-fashioned romances have given way to dramatic novels, descriptions of voyages, and illustrated journals, so the literary magazine of Addison, Johnson, Wilson, and N. P. Willis, is getting thrust aside by engineering and mining journals, railway registers, and periodicals charged with news of all the sciences. While Emerson is quoted by Huxley, Charles Darwin's name appears in the first sentence of a State paper pronounced before the Parliament of the Austrian Empire. The facts discovered by geographers have always interested merchants. But now the ideas elicited by chemists, geologists, botanists, and even archæologists, are taking root and growing kindly at the fireside of tradesmen, mechanics, and laborers. Everybody knows about the geology of the Suez canal, the last batch of heads put upon the Nile by Livingstone, the diatome vegetation of the Atlantic floor, the necessity for having two shafts to a coal mine, and the mistake of three millions of miles in the old measurement of the radius of the earth's orbit. Where will all this end? When peers of England lecture to Mechanics' Institutes, some wonderful leaven must be leavening the lump. When observations on meteors become standing items in penny newspapers, the intellectual life of all classes of society must be lifting itself to a less brutal and more spiritual plane."

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of Dewey & Co., publishers of the Scientific Press. Established in the year 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

DR. ABORN,

Oculist, Aurist,

AND

CATARRH, THROAT

AND

Lung Physician.

No. 22 KEARNY STREET,

SAN FRANCISCO, OAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox. Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months sufferad from Catarrh, accompanied with unpleasant sensations and sounda in tha eara. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. Ha improved my hearing almost instantaneously, and now, after heing under his care six days only, I feel aa if entiraly cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have heen afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a diatresaing cough, and seriously impairing my health generally. I hava heen under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for ahout three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Ahorn relieved me of a very severe neuralgic pain, and with four applications it was antirely cured. S. O. HOUGHTON.
San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

To whom it may Concern.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief hy submitting myself to Dr. Ahorn's treatment for a few daya only, I take pleasure in saying Dr. Aborn, with his new aud improved instruments for local applications to the lungs, air passagea, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in tha left nostril, which has heen called hy different names—cancer, scrofula and ozena—different physiciana have tried their skill in attempting its cure, hut without success. It has rendered me incapable of lahor for tha last two years. Since tho heginning of June last I hava heen in the Sacramento hospital reduced to a mera skeleton. On tho 23d of Novemher I left the hospital, and since the 26th have heen under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel lika another person. The success of Dr. Aborn's treatment in my case shonld he sufficient to encourage all who have chronic discaseato maka another trial for that good prize—health.
WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the henefit of the afflicted and as an act of justice to the skill of Dr. Ahorn, I make tha following statemeut: For ahout two years I was seriously afflicted with a hronchial affection. I had a distressing cough, difficulty of hreathing, axpectoration, night sweats, and was losing flesh very rapidly. I was treated hy five physiciana without any henefit, hut continued to grow worse, and was finally advised hy them to leave tha city, aa in their opinions I could not he cured in this climate; hut my husinesa relations were such as to precludo a change of climate, although my health was decliniug ao fast that I could not hava lived long without relief. Two months ago, when Dr. Ahorn arrived, I read his publications and tho testimonials of his ramarkahle cures, which led me to helieve that thera must ha merit in hia treatment. So I placed myself under his cara, and it is with great pleasure that I am ahle to say that ha haa cured me of thosa distressing and dangerous hronchial affections; also, tha night sweats, cough, etc. I was unahle to attend to husiness sinca April last, until after heing under Dr. Ahorn'a treatment for ona week. My improvement was so rapid that in one week's time I waa ahla to resume my husinesa, and I have continued to gain ever since so rapidly that even my friends ara surprised at the remarkahle results of his treatment.

Important to Californians.
The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

Metallurgy and Ores.

Metallurgical.

The undersigned respectfully announce to the public (especially to parties interested in mining) that they have opened an office at

No. 30 FREMONT STREET.

And WORKS at H. J. BOOTH & CO'S FOUNDRY, northeast corner First and Mission streets, San Francisco, where Ores in small or large quantities of all kinds can be worked by Pan Amalgamation, Chlorination or Smelting, and all kinds of Assays and Analyses made. We will also sample any Ores entrusted to our care; and in all cases returns made in the shortest time possible. We will give consultations on the best methods of successfully working Sulphurets or Refractory Ore.

Drawings Furnished for Quartz Mills, Smelting and Chlorination Furnaces.

By having had long practical experience in working Gold, Silver, Copper and Lead Ores, we hope thereby to get a share of the patronage of the mining public. ☞ Mines Examined and Reports made.

Patent Steam **PUMP**

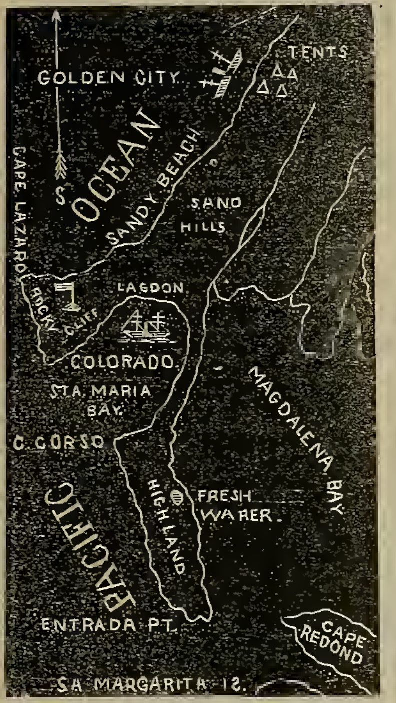
It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular.

BERRY & PLACE, 112 and 114 California st., San Francisco,

Reading for the Hour.

Loss of the Golden City.

The Panama steamer Golden City ran ashore at Point Lazaro, on the coast of Lower California, at 7 o'clock on the morning of the 22d February, and proved a total wreck. Fortunately the sea was calm, and the passengers, crew and treasure were landed without loss. There were about 400 (?) passengers on board, 40 or 50 of whom were women, and some $700,000 worth of bullion. The party remained on shore from Tuesday forenoon until Friday, when the steamer Colorado came in sight, and fortunately perceived the sufferers. As it was impossible to get aboard in their present position, the Colorado steamed to Santa Maria Bay, 25 miles distant, and thither the passengers were obliged to go on foot, and on the way thirteen persons were lost. The rest were brought off by the Colorado, and water and provisions put ashore for those left.



The Golden City was commanded by Capt. Comstock, as Capt. Lapidge was compelled by sickness to remain in this city when the vessel left here. A number of the passengers severely censure Capt. C., but others say he did well under the circumstances. Still we have as yet no explanation of how the vessel came to run ashore. Cape Lazaro is in latitude 24° 40′, being about 1,000 miles from San Francisco, and 225 miles from Cape St. Lucas. We give a diagram showing the general outline of the coast in the neighborhood of the wreck. The drawing was executed from information derived from the log of the Golden City and from passengers of the same vessel by Mr. H. L. Judell, "local" on the daily *Evening Tribune.*

Effect of Sporting on National Character.—Lord Wilton, in his book, asserts and tries to prove that only those nations have achieved and maintained their freedom, who patronize field sports. The *Pall Gazette* comments on this as follows: "The sporting classes have furnished out all the divine right, and passive obedience, and high prerogative men. Our liberties, sad to relate, have been preserved by *tailors and cobblers.*"

The Cardiff Giant swindle has been fully exposed by the makers, who, indignant at not having received their fair share of the profits, have published a card, stating that they made it. Told you so.

Sporting in California.

California is famous for its game, and draws every year a number of people from other places. How long it will continue to present the advantages in this respect which it does to-day, will depend upon the rapidity with which it is populated, and the manner in which sporting is conducted. A San Francisco sportsman can now start off Saturday afternoon and return to the city Monday morning with numerous trophies of his skill, but such cannot long be the case. We copy from the *Evening Bulletin* some remarks on game and sporting outfits:

Guns and Outfit.

The breech-loading shot-gun has to a large extent superseded the old muzzel-loader, but the expense of the ammunition of the former weapon still keeps the latter in the market. The breech-loaders are principally manufactured in Birmingham, Edinburg, London and Dublin. The price of a first-class breech-loader is about $400, and from thence ranges as low as $50. Muzzle-loaders are held at the same cost. The furniture of the shot-guns, such as pouches, powder-flasks, etc., are manufactured by Dixon of Sheffield, and much valued for their excellent finish. The game-bags are imported from Germany, but, however, the sporting men of this coast have given the preference to the sporting-coat, a garment supplied with innumerable pockets, which is manufactured in the city and sold in large numbers, costing about $10 each. Powder and shot are manufactured on this coast, and wads and percussion caps come from Ely of Sheffield. Quantities of the former articles are also imported.

Like the shot-guns, the breech-loading rifles have taken the lead of the muzzle-loaders. The principal rifle purchased in San Francisco for sporting purposes is the Henry rifle. Then the Spencer, Sharp's Ballard, Wesson, Remington, Maynard, Thunderbolt, and many other varieties. The metallic cartridge is used with all. Of belt pistols, Colt's has still the preference, then Wesson and Remington, large numbers of which are sold to the Mexican and Japanese Governments. Colt's new pistol is a very perfect weapon, loading with a brass cartridge, the shell of which can be used several times. Moore's breech-loading Derrringer, and "the Southener," are in requisition as pocket-pistols, and also Sharp's repeating pistol. These are manufactured in the Eastern factories in large numbers. Smith and Wesson's, the Tond, Slocum and the National are the leading weapons among the small revolvers.

Fishing Rods.

The fishing rods used by Walton's disciples in California are imported from England and New York. They are composed of lance wood and split bamboo, the latter description being the best and most expensive article, and ranging in price from $20 to $75. Some are also made of ash, hickory and other woods. The split bamboo rods contain several pieces of bamboo placed together, tapered down, and then carefully wrapped with silk. Trout and salmon artificial flies are imported from England and New York. Silk hair and hemp lines come from England, cotton from New York, and grass from China and Japan. Plain, click and multiplying reels are imported from Europe and the East, the finest, however, are those manufactured in Kentucky. Many old fishermen prefer the plain reel in heavy fishing, and look with contempt upon the click and multiplier.

Game and Hunting-grounds.

Deer, antelope, bear and elk constitute the large game of California. Deer are found among the hills in the vicinity of the city, in great abundance in Marin county, and many hundreds are killed yearly on Tamalpais. The deep gulches, woods and covers of Marin county afford excellent sport to the deer hunter. Elk do not range nearer than the Oregon line, but a few are still met on the banks of the Sacramento and San Joaquin rivers, where in former years they were so abundant.

The brown and black bear are also hunted in Marin county. Along the coast range, San Luis Obispo, Santa Cruz, Monterey, San Bernardino, and Mendocino counties the formidable grizzly lurks, where those in search of more exciting game than duck or quail, do battle with him in his favorite haunts.

White and gray geese are found in all the bay counties, on the lakes and up the rivers in abundance. Duck are shot in the same localities, of which the most valuable is the mallard, which remains and breeds in the country.

Then came the redhead, sprigtail pigeon; wood duck, blue and green-winged teal; broadbill, spoonbill, sawbill, whistler, butter-ball, fan-tail, or Dutchman's and Cadwell's. Quail abound in the surrounding counties, the season beginning on the 15th of September and ending on the 15th of March. In the immediate neighborhood of the city quail are scarce, being trapped and slaughtered for the market so earnestly that they are now almost exterminated. Rabbits are also found in the quail grounds. The English or jack snipe are shot in the fresh water marshes on the San Joaquin and Sacramento rivers, in the Amador, Gilroy and Santa Clara valleys. Of the bay snipe there is an abundant variety, such as curlew, willet white wings, plover, yellow legs, robin, doe-witch, ring-neck and piper.

The grouse, one of the finest game birds, frequents Mendocino and the upper counties of the State. Several attempts have been made to stock the lower counties with these birds, but with little success. Trout abound in all the rivers running into the bay, and are taken by both bait and fly, but principally the former.

Such are some of the sporting grounds of California, but if we wish our game to increase, and our streams to abound in trout, the game laws must be observed, the birds not killed out of season, the rivers not poisoned, and every infringement of these rules punished with severity.

How Soon does Beheading end Consciousness.—Considerable has been said and written, of late, with regard to the time intervening between the beheading of a person and the end of consciousness to the victim. The approach of the late execution in Paris revived this old question, and drew forth a letter from Dr. Plinel, in which he asserted that decapitation does not immediately affect the brain. The blood which flows after decapitation comes from the large vessels of the neck, and there is hardly any call upon the circulation of the cranium. The brain remains, in fact, nourishing itself with the blood retained by the pressure of the air. When the blood remaining in the head at the moment of separation is exhausted, there commences a state, not of death, but of inertia, which lasts up to the moment when the organ, no longer fed, ceases to exist. Dr. Plinel estimates that the brain finds nourishment in the residuary blood for about an hour after decapitation. The period of inertia lasts for about two hours, and absolute death would not ensue till after the space of three hours altogether. If, he adds, a bodiless head indicates by no movements the horror of its situation, it is because it is physically impossible that it should do so, all the nerves which serve for the transmission of orders from the brain to the trunk being severed. But there remain the nerves of hearing, of smell and of sight.

Emery.—D. W. King & Co., of Boston, Mass., sell the entire product of one factory which turns out about one ton of emery per day. The *Iron Age* says that in this factory there are employed a dozen men in the manufacture of Smyrna emery from the pure Turkish stone. The different grades are twenty-four in number, and to produce these the stone has to pass through a large number of crushers, rollers, bolts, cleansers, etc. Four large elevators run from the ground floor to the third story, beside several other smaller ones. The finest grade of emery is produced by a blower, devised by the company. This flour of emery floats in the air in a large room through the day, and when work in the mill ceases over night it becomes settled.

No More Ribbon Stamps.—Owing to the perpetration of numerous frauds on the Government from the washing and re-use of stamps cancelled by the device known as a "ribbon stamp," the Internal Revenue Department have ordered that the canceling shall be done either by writing upon the face of the stamp with ordinary ink, or by cutting or tearing it with some machine or implement designated and approved by the Commissioners, and that no other method of canceling such stamps shall be recognized as valid or sufficient.—*American Artisan.*

The Washington Iron Works at Newbury, New York, have failed. Liabilities stated at $95,000.

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-first day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

fy26 A. J. HOYT, Secretary.

Nevada Land and Mining Company.—Location of Works: Steptoe, Johnson & Latham, Antelope and Cliftou Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of February, 1870, an assessment of two and one-half cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the fifteenth day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fifth day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room 5 No. 302 Montgomery street, San Francisco, California. feb12

North San Francisco Homestead and Railroad Association:—Location of Property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Association, held on the ninth day of February, 1870, an assessment of seven dollars and fifty cents was levied upon the capital stock of said Association, payable immediately, in United States gold coin, to the Secretary, at his office, No. 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the ninth day of March, 1870, shall be declared forfeited, and duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of March, 1870, to pay the delinquent assessment thereon, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, 415 Montgomery street, San Francisco. feb12

Pinto Mining Company.—Location of Works: Silverado, Pinto District, White Pine County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the third day of January, 1870, the several amounts set opposite the names of the respective shareholders as follows:

A VALUABLE BOOK FOR INVENTORS AND ARTISANS.—Dewey & Co., publishers of the SCIENTIFIC PRESS and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the SCIENTIFIC PRESS office, postpaid, for $1,—*New Age.*

THE GREAT MEDICAL DISCOVERY!

Dr. J. Walker's California

VINEGAR BITTERS.

FOR FEMALE COMPLAINTS, whether in young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient. PIN, TAPE, and other WORMS, lurking in the system of so many thousands, are effectually destroyed and removed. ☞ SEND FOR A CIRCULAR. ☜

More than 500,000 Persons

Bear testimony to their wondorful Curative Effects.

WHAT ARE THEY!

They are not a vile

FANCY DRINK,

Made of Poor Rum, Whiskey, Proof Spirits, and Refuse Liquor, doctored, spiced, and sweetened to please the taste, called "Tonics," "Appetizers," "Restorers," etc., that lead the tippler on to drunkenness and ruin, but are a true Medicine, made from the native roots and herbs of California, FREE FROM ALL ALCOHOLIC STIMULANTS. They are the GREAT BLOOD-PURIFIER AND LIFE-GIVING PRINCIPLE, a perfect Renovator and Invigorator of the System, carrying off all poisonous matter, and restoring the blood to a healthy condition. No person can take these Bitters according to directions and remain long unwell.

They are a gentle Purgative as well as a Tonic, possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In Bilious, Remittent and Intermittent Fevers, these Bitters have no equal. For full directions, read carefully the circular around each bottle, printed in four languages—English, German, French and Spanish.

One Hundred Dollars will be given for an incurable case, provided the bones are not destroyed by mineral poisons or other means, and the vital organs wasted beyond the point of repair.

For Inflammatory and Chronic Rheumatism, and Gout, Dyspepsia or Indigestion, Bilious, Remittent and Intermittent Fevers, Diseases of the Blood, Liver, Kidneys and Bladder, these Bitters have been most successful. Such Diseases are caused by Vitiated Blood, which is generally produced by derangement of the Digestive Organs.

Cleanse the Vitiated Blood whenever you find its impurities bursting through the skin in Pimples, Eruptions or Sores; cleanse it when you find it obstructed and sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the Blood pure and the health of the system will follow.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed,

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1yeow

Ayer's Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President......................SAMUEL MERRITT.
Vice-President......................MICHAEL REESE.
Treasurer......................J. SELIGMAN & CO.
Secretary and General Agent.........W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm, H. Sharp, Henry Barroilhet,

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

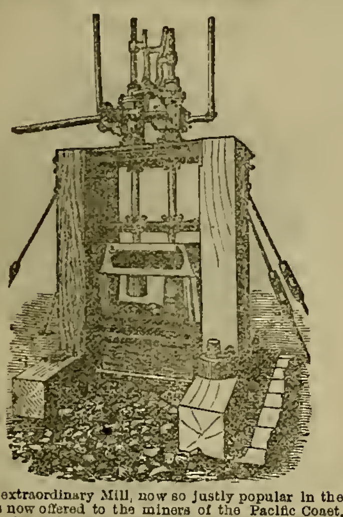
Machinery.

THE WILSON Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

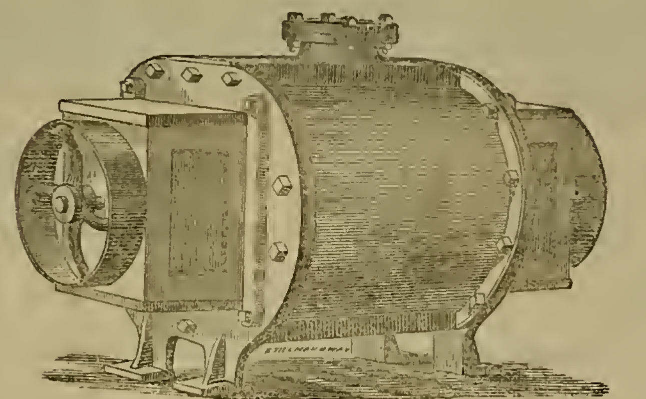
Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,
1v1 San Francisco.

Scientific Press.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of Scientific Press. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information.—*Contra Costa Gazette, Jan., 1870*

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

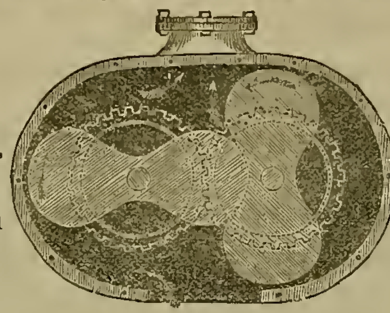
MANUFACTURED BY KEEP & BARGION,
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

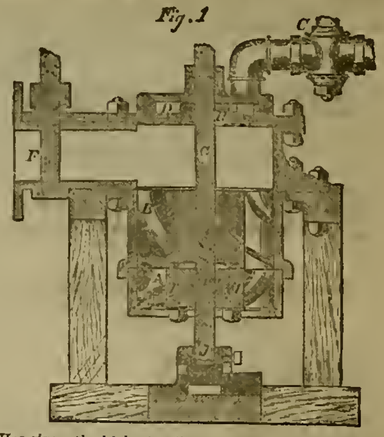
MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

Lind's Improved Water Wheel



Has given the highest satisfaction to parties using it. We are now prepared to sell it at reduced prices. Will also contract for all kinds of Machinery—Flour, Saw and Quartz Mill. All our work guaranteed. We will send competent men to put up our Wheels and Machinery. We contract for or do it ourselves. Our extensive acquaintance with millwrights on this coast enables us to furnish millmen with the best of workmen at short notice. Drawings for contracts furnished gratis. Send for circular.

Year, Month, or Number.

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable*. The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr George K. Glnyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on large scale. 2v20-my

---

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

VOLUME XX.
Number 11.

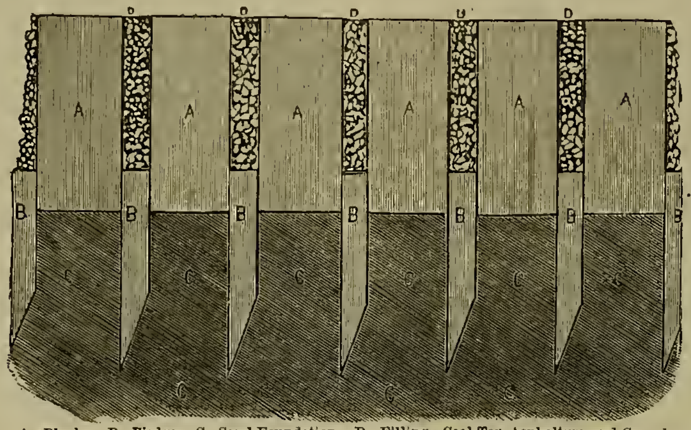
The Stow Foundation Pavement.

Those who have once used the wooden pavement are never willing to go back to the cobble stones. The great advantages of the former in the avoidance of the disagreeable noise and rattle of the passing teams, in the economy of wear and tear of teams, in the superior ease of traction, and the less injury to horses, are everywhere granted. The only objections made are with regard to the supposed expense and necessity of frequent repairs. But the Stow Foundation pavement, as laid in Front and Battery streets, four years ago, where it has been subjected unceasingly to the heaviest hauling in the city, yet remains at the present time as even and unbroken as it was in the beginning. And a most important item is, that during all this time it has not cost the city one dollar for repairs.

The arguments against wooden pavements are almost all *a priori*. There is a general ground taken against wood, that it is extremely subject to decay; yet instances of wooden edifices having outlasted stone structures are by no means unknown. Stone is harder than wood; therefore stone should be the less subject to wear; yet experience shows that the unyielding granite is much sooner ground and abraded into sand than the elastic wood, which yields to the pressure and permits the weight to pass over it without sensible injury to either. Fig. 3 (p. 169) shows the difference in wear between the Stow and the cobble pavement, the view being taken on Battery street, between Broadway and the water front, four years after the pavement was laid, which gives conclusive evidence on this point.

In this city, two wooden pavements have been tried—the Nicolson and the Stow. The Nicolson was first tried, and became quite celebrated for a time, but several defects were discovered; the wood was apt to decay, or to swell in wet weather, and either to press out the curbstones, or to rise in humps and hillocks. The first samples of the Stow pavement were laid in 1866, and its success was so signal, that the City Paving Company, which has the rights of both kinds, lay nothing now but the Stow.

The Stow Foundation pavement, which derives its title in part from the name of the inventor, Dr. H. M. Stow, of San Francisco, and in part from the distinguishing feature of its construction, is so constructed that the wood is kept continually moist, and thus is protected from decay, for it is not the being wet, but the alternation of wetting and drying, which favors the decomposition. In laying this pavement, first, a foundation of sand is made. This is saturated with water so that it shall set compactly, and also that it shall be, so to speak, a reservoir for moisture for the blocks above. This having been properly leveled and smoothed, the blocks, A, are laid (see fig. 1), and between these the wedges, B, are driven into the sand. The whole is then gone over with a smoothing iron, to render the surface even and the whole pavement more solid. Then good clean gravel is poured in over the wedges, and these last driven home, as shown in the figure. More gravel, sand and tar are put in the crevices, and pounded to compress them, and a layer of tar and sand is spread over the whole surface. This result, then, is, that there is a firm foundation of moist sand, rendered still more compact by the wedges; that the blocks are held firmly in place and kept moist; and that the top covering of sand and tar protects the blocks from the action of the atmosphere and insures their durability. Fig. 2 shows the details of the manner in which the work is performed.



A—Blocks. B—Wedge. C—Sand Foundation. D—Filling: Coal Tar, Asphaltum and Gravel.

FIG. 1—SECTIONAL VEIW OF STOW PAVEMENT.

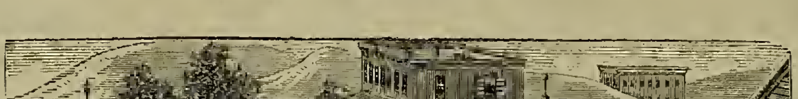


FIG. 2—MANNER OF LAYING THE STOW PAVEMENT.

Strong certificates from the Mayors, the whole Board of Supervisors, Superintendent of Streets, engineers and merchants, attest the excellence and durability of the pavement. It can be taken up in part, to lay gas or water pipes, etc., and relaid with great facility and without injury or break in the surface. The questions with regard to the unevenness and decay of wooden pavements in this city are shown by certificates to have arisen from other kinds, where wrong principles with regard to the preservation of wood have been used. The Stow can be laid at a low price; the saving in the wear of horse-shoes is about one-half of that occasioned by stone, and the saving in the life of horses, according to Dr. Ure, is in the proportion of 5 to 2.

As an evidence of the practical faith in this pavement, we may note the fact that Mr. Philip Cadnc, under whose direction it has been laid in this city, has purchased the right for the State of Illinois for the round sum of $25,000, U. S. gold coin, and is now making arrangements for starting soon for Chicago, with a view to its introduction into that city.

The City Paving Company of San Francisco was formed by the consolidation of the Nicolson and the Stow companies, and numbers among its officers some of the leading men of the city. The President is Mr. H. F. Williams, who is well known here. Its operations are conducted with energy and ability, as might be expected from its management. Mr. Philip Caduo is the Superintendent.

Our interior towns are thriving and increasing at a most healthy rate, and in their cases the pavement question will be soon a very important one. We call their attention, as well as that of this city, to the considerations of cleanliness, noiselessness, durability, economy and humanity involved in this subject.

◆

The New Waterhouse Gear.—Mr. Waterhouse showed us a model of his new movement this week, which differs from the old device in several important respects. We have not the space to speak of it as fully as we would like. It obviates several of the objectionable features of the older apparatus, and seems to us to be a very important step in the right direction. While not new in its separate parts, it is original in its combinations, which form its valuable features. It is claimed that, by actual and careful experiments, the friction has proved to be much less than in other devices, and it certainly seems to work remarkably well. Arrangements have been made for its extensive introduction, and it is now used in a hoist at the fast freight office of Wells, Fargo & Co. We bespeak for it favorable attention.

◆

Telegraphic Extension.—A telegram announces that the sub-marine cable from Bombay to Aden, at the mouth of the Red Sea, has been successfully laid by the Great Eastern, bringing the British colonies of Asia into close communication with the mother country.

Reports from London state that the company is fully organized for laying the cable from England or Wales to New York, and that the necessary capital has been promised. Contracts will be made immediately for manufacturing the cable.

◆

Sale of Crushed and Sampled Ores.—In our article under this heading, we omitted the name of Mr. Henry Hughes, No. 302 Battery street, among the list of commission merchants. Mr. Hughes buys, sells and ships ores on commission only, giving the miner an advance on the value of the ore as soon as determined by assay, and making a final return for the working result obtained, at the earliest possible moment.

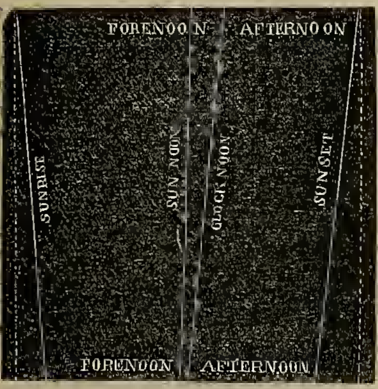
Length of Forenoon and Afternoon.

[Written for the Scientific Press.]

Editors Press:—From the "Notices to Correspondents," in the Scientific Press of January 29th, it appears that one of these, "Natoma," had made some inquiry about the lengthening of the afternoons in winter, while the forenoons were still shortening or about stationary. The Atlantic Almanac, which I have before me, and in which the time of the sun's rising and setting is undoubtedly given to the nearest minute, shows that, at Washington, D. C., for example, the afternoons reached their shortest limit (reckoning only to the nearest minute) on the 2d of December, 1869; the sun then setting at 4 h. 38 m. For about two weeks from that date they *appear* to be the same, though, of course, there is a variation of some *seconds;* on the 15th, a minute is added to their length, and at the end of the month we find they have already lengthened nine minutes, the sun then setting at 4 h. 47 m.

The forenoon, on the other hand, continues to shorten till the 29th of December, or almost a month later than the afternoons, and their length is not increased by a minute till the 11th of January, 1870, at which time the afternoons have lengthened twenty-one minutes. If, therefore, "Natoma's" inquiry was what I have supposed it to be, it was natural and proper enough, and, if I am allowed a brief space for the purpose, I will answer it. It is well known that our clock-time, now almost universally used in civil reckoning, is *mean time*, or average time, and that, owing to certain irregularities belonging to the apparent motion of the sun in the heavens, this mean or clock time often differs considerably from sun time, or *apparent time*, as it is commonly called. This difference, when greatest, amounts to about sixteen minutes, and hence it happens that apparent noon, indicated by the sun's being south or on the meridian, sometimes occurs sixteen minutes before the mean or clock noon, and sometimes sixteen minutes after it. Of course, in the former case, it will make the forenoon somewhat more than a half an hour longer than the afternoon, and in the latter case, the afternoon will be the longer by the same amount. Now it so happens, that just at the season when the days are approaching their shortest limit, say the first of December, the apparent or sun noon occurs about fifteen minutes before the mean or clock noon, and, consequently, the forenoon, as marked by clock time, is nearly half an hour longer than the afternoon, but the two noons are then rapidly coming nearer together, which, of course, has the effect of adding to the length of the afternoon, the forenoon being shortened by the same amount. And as the change in the length of the days near the time of the winter solstice (the 21st of December) is exceedingly slow, the change in the forenoon, produced by the cause just mentioned, overcomes it so far as relates to that division of the day, and the afternoon begins to lengthen before the solstice, or before the day as a whole has reached its shortest limit. The diagram illustrates this, the slope of sunrise and sunset lines showing the shortening of the day; but as the line of mean noon slopes more, relatively to apparent noon, the *clock afternoons* are lengthened in spite of the shortening of the day.

W. D.



Diamonds in California.

[Paper read by Mr. H. G. Hanks before the San Francisco Microscopical Society, March 4.]

An interesting article appeared in the American supplement of the *Chemical News*, for November, 1869, on the occurrence of diamonds in the native platinum of Oregon. The communication is of high authority, being from the pen of Prof. F. Wöhler, of Göttingen. After removing gold, platinum, chromic iron, silica, ruthenium, etc., by the usual methods, he examined the residue microscopically, and observed colorless, transparent grains, which he presumed to be diamonds. Subsequent combustion in oxygen and precipitation of solution of baryta by the carbonic acid evolved, convinced him that the microscopic crystals were true diamonds.

This fact is an extremely important one to the inhabitants of the Pacific coast. It is probably known to all the gentlemen present that diamonds have been found in several localities in California.

This new discovery confirms the opinion of experts, who have held that diamonds might be found in paying quantities in our State. I have brought some of this platinum sand for the inspection of the Society. I have myself long since observed these crystals under the microscope without suspecting their nature.

Platinum.

Platinum, with iridium and associated metals, is found in considerable quantities in Trinity county. At Hay Fork, a considerable stream in that county, all the gold found is more or less mixed with the platinum metals; so much so that dealers deduct two dollars per ounce from the price paid elsewhere for gold dust. At north fork of Trinity river, platinum is found in less quantities, but in larger pieces. One was once offered for sale in Marysville which weighed over two and a half ounces troy.

Although platinum is found in the river beds and on the banks of the streams, yet in the so-called "hill claims," about half a mile only from the river, no trace of that metal has been found. In lower Trinity, near its junction with the Klamath, platinum abounds in very fine particles; and it is with this finely-divided platinum that Prof. Wöhler discovered diamonds.

Where Found.

The metal is so abundant that the miners have the utmost difficulty in separating it from the gold. The particles are so extremely fine that they can hardly be distinguished from the black sand which accompanies the gold. Heretofore no effort has been made to place the platinum in the market, except the sending to San Francisco of 100 ounces or more, a year or two ago. It could probably be sent to Europe to advantage. In Salmon river it is also found. In fact, it is common in the beds of the streams in Sierra, Trinity, Klamath and Del Norte counties. The altitude of Trinity is about 3,500 feet. No search has ever been made for precious stones in this region that I am aware of, except by Mr. Norcross, who claims to have found rubies and opal.

Miners are generally not familiar with the appearance of diamonds in the rough state, and would most likely mistake them, if found, for chalcedony or some similar mineral. If in crystal form, it would be to them a crystal only—interesting for the moment, to be soon thrown aside as useless. I have heard of a case where a beautiful crystal, supposed to be a diamond, being found in some placer mine in California, was put to the following test: It was placed on an anvil and struck a heavy blow with a sledge hammer, it being assumed that the diamond being the hardest of known substances, could not be broken. It is, perhaps, unnecessary to say that the character of the crystal still remains unknown.

Diamonds Have Been Found

At Volcano, in Amador county, in a peculiar volcanic formation, described by Prof. Whitney as "ashes and pumice cemented and stratified by water." I visited the locality in 1865, and examined the place where one of the diamonds was found. I have brought this evening, for your inspection, specimens of the peculiar formations alluded to by Prof. Whitney. The crystals had the form of the Icositetrahedron, with faces curved in the manner peculiar to the diamond. These facts and the late discovery of Prof. Wöhler lead to the assumption that diamonds are likely to be found with the gold of California and Oregon, and may become an important object of search. They should be sought in all river mining claims in California, and especially in the localities where they have been known to have been found. Especially may they be looked for in cleaning up after extensive hydraulic washing.

As those looking for precious stones, and especially the diamond, which takes so many forms, should know something of the appearance of what they seek, I have compiled from various sources such information concerning the diamond as will be of interest and use to prospectors.

Rough Diamonds.

It requires great practice to judge of the diamond in its rough state. A rough diamond of the first water would be hardly recognized by the uneducated eye as a valuable gem. In describing the diamond, many of its characteristics are visible only in its cut state. Half the stone is sometimes cut away before a perfect gem can be produced. The diamond washers of Brazil rub the stones together and produce a peculiar grating sound, from which they assume to judge of their value. Diamonds were discovered in Brazil in 1728. They had always been thrown aside as useless in gold washing, until one who had seen this gem in the rough state, quietly collected a large quantity of them, from the sale of which in Portugal, he realized a fortune.

Characteristics of Diamonds.

The diamond is pure carbon crystallized. It is supposed to be of vegetable origin, and is believed by those who have studied it carefully to be produced by slow decomposition of vegetation or bituminous matters. It is generally colorless, but always transparent (except in case of the black diamond, which is opaque), sometimes yellow, green, blue or brown, colors always light, generally crystallizes in octahedra, but often found in rounded masses, occasionally in curious irregularly concretionary forms, like chalcedony or semi-opal. Frequently the faces of the crystals are curved, sometimes they take a nearly spherical form, having 48 faces.

Although the hardest of known substances, it is not difficult to break it by a blow. Fracture four fold, parallel to the faces of the octrahedron. The fragments are octahedral or tetrahedal. It strikes fire with steel, surface often rough or striated, sometimes covered with a scaly crust. The touch of the diamond is cold. When the cut gem is breathed upon, the luster is lost for a moment, when defects are seen.

Diamonds found in river beds are generally in rolled masses, while those found imbedded in the formations peculiar to their locality are covered with an earthy pale gray, yellow, or rose-red coating. The texture of the diamond is lamellar. Its hardness so exceeds that of other minerals that it scratches them all, and is scratched by none. Its specific gravity is 3.5 to 3.66. It is sometimes found black. Blue and black are its rarest colors. It exhibits a beautiful play of colors in the direct rays of the sun, or bright artificial light. To its luster has been given the name of "Diamond Luster," or "Adamantine Luster." Its refraction is simple, but it possesses this power in a higher degree than most other minerals of equal specific gravity. In consequence of its extreme hardness, it can only be cut by its own powder. The common saying, "Diamond cut diamond," is exceedingly expressive.

Electrical and Chemical Properties.

When the diamond is rubbed, it becomes positively electrical, even before being cut, in which it differs from all other gems. When after exposure to direct sunlight, it is suddenly placed in darkness, it shows phosphorescence, and the evolution of light continues for some time. It is not acted upon by any acid or alkali. But it may be consumed and completely oxydized to carbonic acid at a high heat in the atmosphere. It is so difficult to burn that the ordinary blow-pipe flame has no effect upon it. It may be heated to whiteness in a closed crucible without change, but it begins to burn in a muffle at the melting point of silver. At a high heat with nitrate of potash, it is rapidly decomposed.

Occurrence of Diamonds.

The diamond has been found massive in Brazil. In this form it cuts glass, scratches quartz and topaz. Has a specific gravity of 3.27 to 3.52, and is nearly pure carbon, being completely consumed in oxygen gas. It occurs in kidney-shaped, irregular masses, exterior generally black, sometimes resembling graphite, has a somewhat resinous luster, sometimes takes very singular forms. The outer coating black and resinous, interior crystalline, vitreous and lamellar, like the diamond. The largest piece ever found weighed 46 carats. It has been used in powder to cut other diamonds. The diamond cutters call them "cheese stones."

The diamond is generally, if not invariably, associated with a peculiar granular laminated quartz rock or sandstone, to which the name of Itacolumite has been given. According to Dana it owes its lamination to a little talc or mica. This rock is found in Brazil, in the Urals, and in North Carolina and Georgia. The diamond is also found in a conglomerate called "cascalho," which consists of rolled quartz pebbles in a ferruginous cement. Platinum, gold, rutile, zircon, etc., are almost always the associates of the diamond. Some platinum has been found in Georgia and North Carolina, where a few diamonds have been found.

Discovery of Its Composition.

Newton first suggested the probability of the diamond being combustible. He was led to this opinion by observing its power of refracting light so strongly. It was in 1675 that he advanced this theory. In 1694, the members of the Academy of Florence succeeded by means of powerful lenses in consuming diamonds. Lavoisier and others proved that the diamond was not evaporated, as supposed by the Academicians, but was actually burned. Lavoisier found by his experiment that if air was excluded, no decomposition took place. He burned diamonds in close vessels with powerful burning glasses, and found that carbonic acid was produced, and discovered and announced the striking similarity between their nature and that of charcoal.

Sir George McKenzie found that they could be consumed in a common muffle. In 1797, Mr. Tennant made a decisive experiment by placing a diamond, the weight of which was noted, into a tube of gold with nitrate of potash. The tube was subjected to great heat, which was maintained some time. The diamond was oxydized at the expense of the nitre, and was consumed. The carbonic acid evolved was conducted into lime water, and the precipitated carbonate of lime weighed. It was found to be equivalent to carbon equal to the weight of the diamond consumed, proving it to be pure carbon.

Current Through the Suez Canal.

The New York *Herald* says the most interesting fact about the canal is that a steady current moves through it from the Red Sea into the Mediterranean, varying from three knots an hour, near Suez, to a knot and a half at the Mediterranean outlet. This proves that the level of the Red Sea is higher than the level of the Mediterranean.

"It is simply because of the tremendous evaporation of the Mediterranean. The thirsty winds which sweep across it from the great desert of Africa keep it down below the general ocean level. The evaporation of the Red Sea per square mile, with a roasting desert on each side and nearer the equator, is immensely greater than that from the Mediterranean; but as the Red Sea is only a narrow gulf running up from the Indian Ocean, its aggregate loss is comparatively small. At its northern extremity at Suez, therefore, it is kept nearer the general level of the ocean than is the Mediterranean along the African coast.

Thus the canal has become a river or an arm of the Indian Ocean, flowing into the Mediterranean, and unless this continual current be checked, the flow will, in time, wash down the sandy banks of the canal into its channel and fill it up. If the report is correct a pair of locks will be necessary at the Suez inlet to regulate the flow from the Red Sea. Otherwise, a heavy wind up this sea of several days duration may create such a current in the canal as to choke it up with the washings from its banks in a single night."

* * *

Glass both Translucent and Reflecting.—At a late meeting of the Polytechnic Association of the American Institute, as reported for the *American Artisan*, Dr. Preterre exhibited a glass said to have been prepared as follows: The back of a glass plate like that used in ordinary mirrors is coated with a salt of platinum, and then placed in an oven and subjected to a heat sufficient to fuse it with the surface of the glass. This renders the surface slightly opaque. The result is that with an opaque substance behind it, the glass will serve as a reflector or looking glass, but without such backing will be translucent. It was stated that in Berlin, Prussia, this glass is used for windows, serving to admit light in the day-time, and shutters behind them as mirrors in the evening.

Mechanical Progress.

More About Hardening Steel.—Gordon Broome, F. G. S., writes the *Scientific American* in opposition to the doctrine, held by many, that for hardening steel, cold water is as good as any other liquid. In the first place he says, the water is decomposed when the metal at a red heat is plunged into it, and the oxygen thus freed probably takes away some of the carbon from the superficial layers. The various oils and fats frequently used for tempering would not be open to the same objection, as the chemical changes produced in them are not such as to decarburize the metal.

Again: When irons or steels are heated with animal matter containing nitrogen, a portion of that element is absorbed by the surface of the metal, and, entering into its composition, produces changes. Thus, in the operation known as "case-hardening," iron is heated with leather shavings, horns, hoofs, or other such animal refuse. By this means a hardened surface is obtained, and as the metal is found to contain nitrogen, the phenomenon is doubtless due to the introduction of that element. A similar introduction of nitrogen is effected when nitrogenous liquids, such as urine or leather-parings, are used in the tempering of steel.

Steel in Locomotive Construction.—The incoming president of the London Society of Engineers, at a meeting held February 7th, made locomotives and railway rolling stock the subject of his inaugural address. We quote briefly from the portion referring to the use of steel: "In locomotive construction the use of steel is steadily extending. Much experience has been gained with regard to this material, and the fact is now recognized that its features should be moderate but uniform tensile strength, with great toughness, the chief aim of manufacturers being to keep down its tensile strength to a maximum of thirty-five tons per square inch. As a material for tires, axles, horn blocks, and some other parts, steel has become an established success. Its most important use, however, is for wheel tires. Good steel tires have at least four times the durability of the best iron, and wear with extraordinary regularity on well balanced wheels. Steel has not made so much way as a material for locomotive boilers as might have been expected. The great advantage to accrue from its use is an addition of nearly fifty per cent. to the strength of boilers with the same thickness of metal as in iron."

Crucible Steel in Quantity.—The superior quality of crucible steel for some purposes has been a sufficient reason for its use, although its preparation is expensive, and for large castings otherwise objectionable, inasmuch as it is difficult to regulate the temperature. The *Iron Age* says: "A German founder recently announced a method used by him, by which the difficulties may be obviated, and steel in any quantity melted and cast as readily as iron. He dispenses with crucibles, and melts his steel in a hearth of burned fire clay, capable of containing 1,800 pounds. The furnace is so arranged that at the proper time a bellows can be brought into play so as to bring the heat to the melting point in a very short time. To protect the melted steel against the injurious influences of the gases of combustion, it is covered with a coating, one or two inches thick, or melted green bottle glass, or furnace slag, made on a charcoal iron furnace, great care being taken to exclude any sulphur. About seventy pounds of glass or slag will be needed for every 100 pounds of steel."

Taking Soundings Without a Line.—At a late meeting of the Polytechnic Club of the American Institute, an apparatus for this purpose was exhibited, which measures the depth sunk by means of a screw something like a steamer's propeller in shape, connected with which is clock-work and an index, for registering the number of turns made. A weight being attached, it is thrown overboard. Upon touching the bottom the weight disconnects itself, and the apparatus rises by means of its float to the surface. The screw revolves during the ascent in the opposite direction, and has no influence upon the index.

Bell Casting.

We find the following in the Birmingham correspondence of the *Engineer:* "There are two ways of making moulds for bells, the core in both cases being made of a brickwork or cast iron cone covered with moulding clay, 'swept' into the shape of the inside of the bell by a wooden 'sweep' or 'crook' fixed to a spindle set up in the middle of the core; the advantage of an iron core being that it can be lifted into a furnace to dry instead of being dried by lighting a fire beside it, as is necessary in the case of the brickwork core. The first, or old method, is to make a clay bell on the core by means of another crook, and when this is dried to make the outside mould or 'cope' on the top of it. This cope has hair and hay bands, or enlarged castings, iron bands, worked into it to make it hold together, and left off when dry. The clay bell, or 'thickness' is then knocked to pieces, the cope dropped down again over the core, and weighted with earth in the pit in which the bell is cast. The metal is then poured in at one hole at the top, another hole being left for the air to escape. In the other method no 'thickness' is made. The cope is an iron case lined with clay, and swept out by an internal sweep to the outward shape of the bell. The 'wires,' or ornamental rings round the bell, are made in both cases by the second 'sweep,' the letters, ornaments, etc., being stamped in the soft clay. These iron copes can be bolted down to a plate under the core, and consequently need not be sunk so deep in the ground, provided only that care is taken to get a high enough 'head' or metal above the bell to insure a good quality of metal in the upper part."

American vs. English Hardware.—The Birmingham Chamber of Commerce, at its semi-annual meeting, February 4th, discussed the depression in the English metal trades, and very sensibly decided that it was not due to the price of labor, nor to the American tariff, but to the superiority of American goods. We quote a paragraph from an article in the London *Times* of the 5th:

"High as are the wages of an English artisan, those of an American artisan are higher still, and yet the manufacturers of the United States can import iron and steel from this country at a heavy duty, work up the metal by highly-paid labor, and beat us out of the market after all with the manufactured article. How is that to be explained? The Americans succeed in supplanting us by novelty of construction and excellence of make. They do not attempt to undersell us in the mere matter of price. Our goods may still be the cheapest, but they are no longer the best, and in countries where an axe, for instance, is an indispensable implement, the best article is the cheapest, whatever it may cost. Settlers and emigrants soon find this out, and they have found it out to the prejudice of Birmingham trade."

A Sixty-Ton Crane.—*Engineering* for Feb. 11th, illustrates a crane recently built to lift thirty-ton guns into and out of vessels. It is said to be capable of lifting double that weight. We give part of the description: "It consists of a strong base-plate firmly screwed down by four five-inch bolts to a solid concrete foundation thirty feet deep. The base-plate is fitted with a wrought iron crane-post twelve-inch diameter, on which the whole structure revolves. The jib end of the crane frame is supplied with two strong cast iron rollers three feet diameter and twelve-inch face, resting on a cast iron roller path. The slewing motion is communicated by suitable gearing from the engine shaft to the rollers. The side frames are of cast iron, substantially proportioned. The jib consists of two rolled girders of H section, forty feet long, and firmly stayed together by distance pieces riveted in. The tension rods are four and one-fourth-inch diameter, and forty feet long, and are connected to the top of the crane framing and the end of the jib. Between the jib and the tension rods are distance pieces which support the rollers for carrying the chain."

Scientific Progress.

Tubercle Communicable through the Stomach.—It is known that tubercle, the grain-like formation which is the cause of pulmonary consumption, may be communicated by inoculation. Prof. Chauveau, of the Lyons Veterinary School, has recently made experiments which prove that the mere introduction into the stomach of the tuberculous matter is sufficient to communicate the disease. We find the following in an exchange: "M. Chauveau purchased four heifers, and tuberculized three of them, by causing them to swallow an ounce of tuberculous matter, taken from the body of an old phthisical cow. At the end of twenty days, the first had lost flesh to a surprising extent; its pulse was quick and full, and it coughed incessantly. At the end of fifty-two days it was killed, and it presented perfectly marked tuberculous changes, especially about the mesentery. The intestines were also tuberculous. The lung was full of crude tubercle. The other two heifers exhibited not less perfectly marked alterations, while the fourth, to which none of the tuberculous matter had been administered, remained in good health and had gained in flesh. If bovine phthisis be identical with tuberculosis in the human species, there is, in the use of the flesh of tuberculated animals, danger. Experiments on dogs, and guinea pigs, in which tuberculous matter in the form of caseous pus, was injected into the veins, were followed by general miliary tuberculosis."

Liebig vs. Pasteur.—These two scientists have supported opposite theories of fermentation. Pasteur says: "The chemical process of fermentation is essentially a phenomenon of life; it begins and ends with it; an alcoholic fermentation without simultaneous organization, growth, and development, that is, without continuous life, is impossible." Liebig says the vital operation and the chemical action are two phenomena which are to be considered separately. Pasteur some years since declared that Liebig's explanation of the action of yeast on sugar was unscientific. Liebig has remained silent in spite of several attacks; but has recently sent forth a paper which is said to be an exhaustive and convincing reply to all of them. An exchange thus comments upon it: "It is so popular, not to say fashionable, to refer every vital action back to the formation of cells, and the building up of protoplasm, and to intimately connect life and matter together so as to gradually support the doctrine of spontaneous generation, that the publication of Liebig's great paper must be looked upon as a timely protest against the tendencies of the age."

Dissociation.—Prof. Seely, in a paper recently read before the New York Lyceum of Natural History, urged that the word "dissociation," which has been proposed for the resolution of chemical compounds into their constituents by the agency of heat alone, is not needed. He says it is not so exact nor so expressive, as the phrase "decomposition by heat." It is not proved that the amount of heat required for decomposition is the same with that evolved in the union of the same elements. "Near the point of decomposition by heat alone,"—he says,—"the affinity is at its minimum, and causes which at lower temperatures might be totally inoperative, may promptly determine the decomposition. It may, therefore, be impossible to arrive at the normal temperature of decomposition by heat alone. In practice it has been found that the temperature of decomposition is often below that of union."

Picrate of Potash and Ozone.—A recent violent explosion of picrate of potash in Paris has been attributed to the unusual quantity of ozone contained in the air. While the matter was undergoing judicial examination, Regnault discovered that when picrate of potash was projected into a flask containing ozone there was an immediate explosion. This may lead to the discovery of new tests for ozone and to new uses of picric acid.—*Journal of Applied Chemistry.*

Organic Matter in the Atmosphere.

Prof. Tyndall, in the first of the course of lectures now commenced for the season at the Royal Institution, showed that the dust with which the air we breathe is filled, and which causes the track of a beam of solar light to be distinctly visible through a dark room, is chiefly made up of organic matter. This was discovered in the course of his researches on the decomposition of vapors by light. "It was,"—he says,—"essential that the space containing the vapors should embrace no visible thing; that no substance capable of scattering the light in the slightest sensible degree should, at the outset of an experiment, be found in the tube traversed by the luminous beam. For a long time I was troubled by the appearance there of floating dust, which, though invisible in diffuse daylight, was revealed by a powerfully condensed beam. Two tubes were placed in succession in the path of the dust; the one containing fragments of glass wetted with concentrated sulphuric acid; the other fragments of marble wetted with a strong solution of caustic potash. To my astonishment it passed through both. I tried to intercept this floating matter in various ways; and on the 5th of October, 1868, prior to sending the air through the drying apparatus, I carefully permitted it to pass over the tip of a spirit-lamp flame. The floating matter no longer appeared, having been burnt up by the flame. It was, therefore, organic matter. When the air was sent too rapidly through the flame a fine blue cloud was found in the experimental tube. This was the smoke of the organic particles. I was by no means prepared for this result; for I had thought with the rest of the world that the dust of our air was, in great part, inorganic and non-combustible. * * * From spectrum analysis, however, we know that soda floats in the air; these organic dust particles are, I believe, the rafts that support it, and when they are removed it sinks and vanishes."

Phenols as Azymotics.—Dr. Squibb, one of the most thorough pharmaceutical chemists in this country, has experimented largely on the application which may be made of the phenols,—as carbolic acid, creosote, etc.,—in the destruction of the microscopic organisms which cause what are called "zymotic" diseases, or diseases produced by fermentation; such as cholera, malaria, and others. This peculiar power, that of destroying the lower forms of life, he expresses by the word "azymotic." His experiments were not confined to the treatment of disease, nor to the disinfection of hospitals, sewers, and outhouses; he demonstrated the value of the phenols in the preservation of meat. A piece of meat was soaked for one hour in a one per cent. solution of phenol, and hung up in a room where there was a fire almost daily. In two weeks it was dried to one-fourth its original size, but looked and smelt perfectly fresh; and after being soaked twenty-four hours in water, was stewed and eaten.

Determination of Blood Stains.—The crystals of hæmatine can be detected by the microscope; but to determine whether a stain is of human or brute blood requires something more. Neumann has subjected the matter to extended experiment, and published the results. Nineteen colored plates of as many different kinds of blood as seen under the microscope, show the difference, it is said, distinctly. He recommends moistening the stain with distilled water, and then heating to 60° Fah. on the glass side of the microscope. The picture which it then presents may be compared with his plates.

The Oldest Spot on the Globe.—Prof. Kerr, State Geologist of North Carolina, in speaking of Black Mountain in that State says: "These rocks belong to the most ancient of the azoic series. The intensity of the metamorphism, the characteristic rocks and their contained minerals, together with the total absence of anything like organisms in even the least altered and latest of the series, render this conclusion inevitable. And not only do they belong to the lowest geological horizon, but the entire absence of all representatives of the later formations makes it further necessary to conclude that we have here an extensive tract of the oldest land on the globe."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Fine Ore.—*Miner*, Feb. 26th: An assay of choice ore from the Monitor C. Tunnel No. 3, gave a return of $1,463 per ton in gold and silver.

Schenectady.—The lower tunnel is getting into softer rock and good headway is now made. Good ore is still coming out of the upper works, and the quantity accumulated will justify the erection of reduction works.

Leviathan.—The lower tunnel is in 240 feet. The rock begins to show signs of copper.

Items.—Companies are being formed in London and in the Western States to work Alpine mines. Silver Glance charter has passed both Houses of the Wisconsin Legislature....An assay just made of ore from the workings of the London Co. went over $1,300.

AMADOR COUNTY.

Oneida.—*Ledger*, March 5th: Work at this mine progresses finely. The mill is running continually, and the body of rock they are now on is extensive.

Gold Dust.—Mr. Reichling purchased, for the week ending Tuesday, over 130 ounces of dust.

Underground Quartz Mills. — The Sheriff, in search of sulphurets stolen from the Sutter Creek chlorination works, on Saturday, found several places, underground, fitted up for the purpose of working quartz specimens. In one of them was a four-stamp hand mill, in complete running order. The owner said that for some time he had purchased, and worked on the share, large quantities of rich rock.

BUTTE COUNTY.

Mining.—Oroville *Record*, 5th: The rains have been sufficient to keep the principal mines in operation for a month or six weeks, and all are busy.

CALAVERAS COUNTY.

Unexampled Yield.—*Chronicle*, 5th: One and a half tons of quartz, from the mines of Lewis Bros. & Co., near the south fork of the Mokelumne, two miles from Railroad Flat, yielded 29 ounces of gold—averaging $348 per ton. The rock was worked by the Thoss process, at West Point.

Palomo.—The excess of water has succumbed to the pumps, and the mill is again in operation.

Brackett & Co., who have been drifting for the lead, have again struck it, and are taking out rich gravel.

Machinery.—Lewis & Co. have purchased the engine and battery of the Golden Gate Co., and will remove them to Railroad Flat.

Mosquito Gulch.—Cor. of same: It is reported that operations of the mill at Scull Flat have been suspended, owing to the fact that it failed to pay. The new mill of Mr. Thoss is said to be the greatest gold-saver yet.

KERN COUNTY:

Walker's Basin.—Cor. of Visalia *Delta*, March 2d: A company has been incorporated at Sacramento to work the Joe. Miller mine. There is a 20-stamp mill on the ground. A pump of great power is on its way. Havilah is dull. There are six quartz mills in and near the town, and none of them running.

NEVADA COUNTY.

Rocky Bar Co.—Grass Valley *Union*, Feb. 29: The stock has all been sold, and Thomas Findley, William Watt, David Watt, Robert Watt and James Kerr have become the purchasers. This company also owns all the quartz leads on New York Hill, with the exception of the N. Y. Hill Mining Co's ledge.

Eureka. — This Co. cleaned up over $14,000 for the six days' run up to Saturday.

Perrins' Mill.—A drift has been run in 260 feet under the ledge, beyond the old workings. The ledge is very flat. Two stopes are to be opened up, and in three weeks regular crushings will begin.

Eureka.—March 2d: Three bars, worth $27,300, were made yesterday. This came from twelve days' run of the mill, and does not include any proceeds of sulphurets, nor have the batteries been cleaned up within the time.

Randolph Hill.—Same, 5th: Webster & Co. have drifted fifteen feet, taking out gravel. Only one pan of dirt had been tried in this drift, and that gave $2.50. They will commence systematic work in a few days. The same of the 6th says the result of the first working, 16 hours' work for one hand, was 6¼ ozs.

Rich Rock.—The Empire Co., Ophir Hill, were taking out very rich rock yesterday. The gold showed plainly all through the quartz.

Greenhorn.—Same, of 6th: In February the mill commenced crushing, and has run twenty-two days, reducing 320 tons of ore. The yield is gold in bars valued at $6,000, with sulphurets saved and specimens valued at from $1,500 to $2,000. During the last ten days, one of Knox's pans has been run on the tailings, which have been concentrated and saved. From these 130 ounces of amalgam were extracted. The company have four times as much tailings saved as they have worked, and are putting in two more pans. The rock can be mined and milled at a trifle less than $6 per ton, which gives a clear profit of $20.

New Mill.—*Gazette*, March 2d: Dower, Cady and others have been putting up a quartz mill on the Banbury ledge, Eureka district. They purchased the machinery at the Gold Tunnel. The mill has six stamps, and will be run by a hurdy-gurdy wheel.

Banner.—*Transcript*, March 1st: The Star Spangled Banner has struck, at the 620-foot level, the best rock ever found in the mine. They have a ledge in the drift and one below, the lode being four feet. George Saulsbury & Co. have discovered a very rich ledge beyond the Banner. Specimens are rich in free gold and sulphurets, and the ledge is of large size.

Spring Hill.—This Co. will soon remove the machinery purchased from the Rocky Bar Co. and will commence their shaft this week.

Lost Hill.—Same, of 5th: The hydraulic claims, formerly owned by Arbagast, and recently purchased by Nevins & Co., will be started up to-day. These claims have been newly fitted up, 2,000 feet of 11-inch pipe laid, and other arrangements made for lively work.

Saulsbury Mine.—*Gazette*, 8th: We were shown yesterday, by G. W. Saulsbury, some very rich specimens from a ledge of which he is the sole owner, two miles and a half east of the Banner mine. The specimens are very rich in free gold and sulphurets, and Mr. Saulsbury informs us that the ledge shows gold in every place where it has been opened.

The *Transcript* says this is one of the richest discoveries ever made in the district. The rock is similar to that of the Eureka, and the best is estimated to pay $1,000 per ton.

PLACER COUNTY.

Horse-Shoe Bar.—Cor. of Auburn *Herald*, March 5th: Prior to the last rains, the owners of hydraulic and sluice claims were in despair, while those along the Middle Fork were loud in praise of the weather. In the last named the mines averaged well the last year, Matt Haslett's, Ned Early's and Tom McCall's being the principals. We anticipate an early fluming season.

PLUMAS COUNTY.

Struck it Rich.—Quincy *National*, Feb. 26th: We are informed that a Mr. White has discovered some rich placer diggings near Indian Creek, three miles above Soda Bar. The claim promises to be extensive, and the gravel prospects as high as $4 to the pan.

SAN DIEGO COUNTY.

The New Strike.—A Los Angeles telegram of March 6th says: Intense excitement prevails at San Diego, created by the discovery of rich gold mines in that vicinity. The exhibition of twelve hundred pounds of rock brought in from the George Washington ledge, seems to have started the rush. The quartz is free from sulphurets and is literally full of free gold. The half ton shipped to San Francisco, will yield from one to two thousand dollars. The George Washington is located forty-four thousand feet, and runs nearly east and west, two to four feet wide. In the talcose slate at the surface there was found rich, decomposed rock, from which some dust was extracted, which went up on to-day's steamer. Two other locations were made, which take up in all two miles. On this lead a district has been formed, called the Julian. The distance by the road from San Diego valley is sixty miles.

Latest.—The above news is fully confirmed by the arrival in the city, on the 8th, per steamer from San Diego, of about half a ton of extremely rich gold-bearing quartz. Letters accompanying it say that one lode extends 15 miles, and that all around it the dirt will pay from half a dollar to two dollars and a half to the pan. Several ledges have been discovered. The town of San Diego is almost emptied by the stampede to the new mines.

SANTA CLARA COUNTY.

A Gilroy telegram of March 5th says: Some specimens of coarse gold were brought from Hollister to-day. Exaggerated reports are being circulated in regard to the richness of the Hollister placers. The first find was made by three Canadians, who, some time since, purchased an acre of land and erected a building; while digging the cellar gold was found. Considerable excitement prevails, and claims are being staked out in all parts of the town.

SHASTA COUNTY.

Janesville.—*Courier*, 5th: The miners are doing "bully." Bennett & Phillips cleared $8 per day during their last run. The Murray claim is in fine running order, and is supposed to pay as high as an ounce per day. A few days ago a miner made a prospecting run of 3½ days under Garden & Reagan's ditch, and cleaned up seven ounces.

TRINITY COUNTY.

Rich Mines.—*Journal*, Feb. 26th: There was considerable excitement in town during the week owing to reports of large prospects on Dutton's creek. A number from Weaverville visited the mines and brought back glowing accounts. The first location was made on the 7th, by Dixon, Connay & Mooney. The thing was kept quiet, but finally got out. As yet but little is known about it.

TUOLUMNE COUNTY.

Kincaid Flat.—Sonora *Democrat*, March 5th: James Maclean advertises for bids to run one hundred feet of tunnel in the claim. The tunnel is now six or seven hundred feet in, and will probably require to be run as much farther.

YUBA COUNTY.

Camptonville.—Cor. of Marysville *Appeal*, March 4th: The claim of B. P. Hugg & Co., west of town, is doing a fair business. The Co. have 500 feet of pipe, and are piping day and night. A Welsh Co. are digging a tunnel, and will commence washing soon. Young's Hill, Oak Valley, Willow Creek, Brandy City and Pike City are flourishing, and are all supplied with mills.

Arizona.

From Walnut Grove.—Prescott *Miner*, Feb. 19th: Tiernan and Gennng were in the best of spirits about their quartz operation. They had not made a clean-up, but had prospected sufficiently to satisfy themselves that success lay at the bottom of their arastras.

Big Bug.—The mill was running at latest dates. Another clean-up will be made next week.

Wickenburg.—A private letter says that the Vulture mill was doing well, yet times were hard and money scarce.

News from the Prospectors.—We are in receipt of two letters from the party. Feb. 1st, they were preparing to start from Mohave City. They go to the Little Colorado. They numbered 32. Philip Richardson leads them.

Colorado.

Brown.—Georgetown *Miner*, Feb. 24th: The condition of the two levels westward on the lode, 220 feet from discovery, developed a body of ore superior to any heretofore opened in the vein.

Terrible.—The main shaft has reached a depth of 250 feet, and shows a vein of first class ore. Ore in large quantities has also made its appearance in the workings west, which contains silver at the rate of 664 ounces per ton. A large amount of ore is on hand.

Mountain Lamb.—This is a recent discovery on Sherman mountain. The ore is extremely rich in silver, averaging when dressed more than $1,000 per ton, in coin.

Par Lode.—The workings on the east half are yielding fair quantities of very rich ore. Several tons on hand at the shaft contain from $700 to $900 per ton

Cliff.—Work has been re-commenced on this vein. Contracts are let for running an adit 200 feet in length, the greater part on the line of the vein.

Marshall.—This tunnel has penetrated 550 feet, and is being rapidly pushed to the Compass and Square lode. Several veins have been crossed, but have not yet been opened by drifts. Ores from one near the head of the tunnel, assay 266.4 ozs. per ton.

Items.—*Register*: Dr. Buchanan, from Georgetown, reports that Frank O'Brien has struck a fine vein of ore in the east end of the Brown lode; that work is going forward on the Nickolls lode; that Frank Dibbin has completed a $20,000 sale, and has the money.

The *Register* also says: Mr. Teats has concluded the sale of the Coaley and Gilpin county mines, receiving barely cash enough to pay off the amount secured by trust deed, between twenty and thirty thousand dollars. He still retains an interest in the mine; the purchaser agrees to work it.

Rich Ore.—Boulder *News*, Feb. 22d: The lode of Pickle, Mishler & Co., in Grand Island District, is three feet wide at the depth of 65 feet. The lowest of five assays is $100 per cord, coin value. Selected ore has assayed $16,000 per cord. They are shipping to New Jersey for treatment, at a cost of $31 per ton, freight.

Idaho.

Winter Diggings.—*Statesman*, Feb. 17th: A large number of white men and Chinamen have been working on the bars of Boise river all winter with rockers. For six miles below the mouth of Moors's creek men are located, some of them making good wages.

Poorman.—*Avalanche*, Feb. 26th: The main shaft is down 500 feet, substantially timbered the entire depth. It is the finest shaft in Idaho. As the vein inclines to the east, a cross cut, now in 35 feet from the bottom of the shaft, will soon intersect the ledge. Four parties of tributers are taking out ore. They deliver it on the dump free of expense to the company, who haul and work it for one-half the proceeds, providing it pays $30 and upwards per ton. If less than $30-ore is taken out the company receive $15 for the expense of working.

Red Mountain.—Pete Nick is pushing night and day. The way of ingress and egress is by the Silver Legion shaft, which is 100 feet deep. The vein is from fifteen inches to two feet in width, and presents a good showing of free gold with considerable silver. Work has been commenced on the second extension. A shaft is down 12 feet. The vein is only four to six inches in width, but is exceedingly rich in gold.

Peck & Porter.—The Davis Bros. are working the Peck & Porter and Corduroy by contract. The main shaft on the former is 175 feet deep, from the bottom of which a drift has been run north 100 feet.

Reported Placers.—Another gold excitement is raging here now. It is reported that rich and extensive placer diggings have been discovered just above Clark's Ferry, on Snake river, something over 100 miles from this place.

Loon Creek Mines.—Oro Grande correspondent of Helena *Gazette:* Discovery Bar has had several drifts started into it, one of which has been run in 100 feet by Baxter, Banane, Leyden & Co., and they have struck prospects which they think will pay from seven to eight dollars per day to the hand, and have not yet reached the channel. Another drift, two and a half miles below, is being run by Windsor & Co. I have been assured that they have a paying prospect; yet they have only run their drift 60 feet. Other drifts have been started, but for various reasons work has been discontinued. Mayfield & Co. have prospected across the upper end of the bar and found nothing. In the main creek good prospects have been struck on several claims which were worked last fall with indifferent success.

Montana.

Emigrant Gulch.—Helena *Gazette*, Feb. 24: Letters have been received saying that very rich diggings have been struck in Emigrant gulch. It is reported that a party who have been there two years, have finally struck bed-rock at a depth of 40 feet, and obtained as high as $73 to the pan of dirt. A guard is constantly kept over the shaft, and the matter is kept "dark," until interested parties secure their ground,

Philipsburg.—The St. Louis mill is running like a quarter horse broke loose. The parties getting ore crushed appear to be in good spirits. They are getting their mines opened in good shape, and are taking out splendid ore....The Cole Saunders Co. are at work on the Speckled Trout lode. They are down 50 feet....The P. M. J. mine looks very encouraging....There is every indication that there will be lively times here in the mountains this coming season....The mill here averages fifteen tons per day, at $20 per ton.

Big Nugget.—On February 15th, a piece of gold, weighing six and a half ounces and half a pennyweight, was taken out of Nelson gulch, within a few miles of Helena, by A. L. Jarl & Co.

Cedar Creek.—Sweeney district claims are laid over until March 15th. In the main Oregon gulch, on No. 106, the drain ditch is thirteen feet deep, and the gravel getting hard. In Barrett district, the result of the first sluicing on No. 3, below discovery on hill claim, was $12.50 to 15 wheelbarrow loads of dirt. The next day the result from one half set of timbers was $35.

Radersburg.—Virginia *Times*, Feb. 25: The quartz claims have proven remarkably rich near the surface. Keating and Blaker have worked 100 tons from the Keating lode in Nave's mill, which yielded $35 per ton, free gold.

Highland—The Only Chance Co. have erected a whim in their tunnel, and are sinking their main shaft. They will be prepared for a good season's work. The Nevins tunnel is being put in with energy. Billy Flowers has been running the tunnel along the Only Chance lode and has struck a splendid body of ore in claim No. 1. The quartz specimen which you remember, has been pounded up, and yielded $575; it weighed 42 pounds, and was from the Meyers & Harvey lode on Black Tail gulch. Among the new discoveries, is one by Johnny Cannovan, opposite discovery. It is estimated at $50 per ton.

Summit.—Cor. of same: The workmen in the How Tunnel have been going through a ledge of very hard limestone, supposed to be the footwall of the lead. The indications are very flattering.

The Covely Brothers have been taking out rock from the Keystone during the winter. They crushed 100 tons in the fall which ran $39 per ton, and 80 tons previous running $46 per ton, and this exclusive of hundreds of dollars' worth of rich specimens, picked and pounded out from time to time. They own 300 feet near discovery, half of which has never had a pick struck into it; quartz from nine inches to two feet wide, shaft 100 feet in depth, perpendicular.

Elk Creek.—*New North-West*, Feb. 18: The ground is principally owned by six bed-rock flume companies. It pays from $12 to $20 per day to the hand. The diggings are from 10 to 18 feet deep, all of which is gravel. About 150 inches of water is now running, and the ordinary spring head is from 300 to 400 inches. They will employ 60 or 70 miners, and maintain a population of 150 men.

Nevada.

HUMBOLDT.

Galena.—Cor. of *Register*, March 5th: Work has been suspended on the Shiloh, owing to deception having been practiced upon the lease-holder, by parties from below with whom the company had made arrangements for disposing of the ore. There will be 27 mills here by June 1st. The Butte mine was tapped yesterday at a depth of 100 feet by the tunnel, which is in 130 feet. The vein is two feet and assays well. The company have increased their force. Ten tons of ore was shipped to-day, for San Francisco. Ten tons more to be shipped in a few days to Oreana for reduction.

The Holt Mill.—We learn that the Holt and Webb mill has started up, and is crushing ore from the Register mine, Gold Run.

REESE RIVER.

From the Southwest.—*Reveille*, Feb. 28th: The operations of the Silver Peak and Red Mountain Co. are carried on successfully. At Red Mountain the 30-stamp mill reduce daily some 40 tons of gold-bearing quartz. The principal vein is 40 feet wide. The extensive property of the company at Silver Peak is lying idle, and there is no present prospect that it will be developed. In Palmetto the Catherwood mill was idle. There was considerable activity in Columbus district, 30 miles northwest, where Eaton's mill was producing silver bullion.

Bullion Shipment.—On Saturday the Manhattan Co. shipped overland nine bars bullion, valued at $14,055.87; to-day, six bars, valued at $9,017.56; total, $23,073.43. During February, Wells, Fargo & Co. shipped from their office in this city, bullion valued at $101,426.01. It was nearly all produced by the Manhattan mill.

Large Assay.—We were shown on Saturday a certificate of assay of ore from a mine in Lander hill, the figures of which were $4,682.

WASHOE.

Hale & Norcross.—*Enterprise*, March 6th: This company is extracting 170 tons of ore per day. The Railroad Co. have finished a side-track under the ore houses. On the lowest level, a cross-cut has been run on the boundary line of the Savage, disclosing a body of ore 14 feet wide, which will mill $35 per ton.

Ophir.—The water is again up—over 100 feet yesterday. Night before last it was found that the wooden cogs in the pump drive-wheel were worn out, and nothing could be done but to shut down for repairs. It was ten hours before all had been made right again.

Sacramento & Meredith.—Grading for the new mill was commenced Thursday. The site is just below the Geiger grade, in the immediate vicinity of the mine. The ore can be dumped through a chute down to the mill, or a tunnel can be driven directly from the mill. An abundance of excellent surface ore is being accumulated on the dump.

Belcher.—Good progress made drifting at the 730-foot level; the quartz looks encouraging. The 152-foot level gives a regular yield of fair ore. The present yield of the mine is 40 or 50 tons per day, which is sent to the Rhode Island mill for reduction.

WHITE PINE.

Weekly Mining Review.—*Empire*, Mar. 6th: Since last report the weather has been so unfavorable that little has been accomplished. Operations have been commenced on a number of mines that have lain idle since last summer. Base metal mines are yielding a large amount of ore. Hundreds of tons are on the dumps, which the storms have prevented being removed. For this reason several furnaces have been obliged to suspend operations.

Bullion.—The bullion shipped from the office of Wells, Fargo & Co. last week was valued at $16,525 37, and the shipments for February amounted to $111,901 59. Base bullion shipped amounted to 61,038 pounds, or 30½ tons. The value of this, at $210 per ton, is $6,405. There are now 120 tons ready for shipment, valued at $25,200. Van Wyck & Co. shipped 5,600 pounds of copper skimmings, assaying $275 per ton.

Mills.—Big Treasure, Swansea, Nevada, Stanford, White Pine, Henderson, Stone, Bartlett and Vreeland, are running. The Little Treasure mill is to be changed to a 20-stamper. The Manhattan and Dayton mills are idle for want of ore, owing to the bad roads.

Items.—Eberhardt continues to yield the usual amount of high grade ore. The prospect was never better....South Aurora yields a large amount of ore daily, and the dumps are piled with it....The rich ore struck lately in the Hidden Treasure is extensive. The tunnel is in 200 ft....Blackfoot has a 12-foot ledge, and is going to be one of the "big things."....Solace shaft down 110 feet....Nellie Mack shows fine ore....A large amount of ore is being taken out on Pogonip Flat.....Several mines on Pocotillo Flat have good prospects....Alsop smelting works run off 7 tons of bullion per day....Van Wyck's closed for repairs....Wiland started up yesterday.....White Pine Smelting Co. have kept one furnace running, and turned out 4 to 5 tons bullion per day....Silver Springs works ready to start....Shermantown works shut down for repairs.

Items.—We find the following in the *News*, March 1st. (The weekly review prepared by that journal reaches us too late for use): The bullion shipment of Aurora South for February foots up $35,826 12. This was the product of 24 days' run of the Stanford mill....Yesterday the final shot in the Blackfoot turned out a mass of rich chloride....3d: Twice as many men are working on Treasure Hill as were working four weeks ago....4th: Rainbow No. 2, on Lower Chloride Flat, is to be started up again. The company owning it will also start work on several of the mines. Among these the Minna shows ore which assays $254 to the ton. The Ingleside, another of these, assays from $90 to $250.

Ely District.—*News:* There are between 500 and 600 men in the District, the majority of whom are broke. The mines are good, but their wealth will not be available until custom mills are put up. The people are discussing the propriety of starting a newspaper, but no money has been "put up." The camp will not amount to much before June or July. *Empire:*—Mr. Keefe says the Pioche, Burk, Poorman and several other mines are yielding ore of high grade. Some ore was brought in which will yield about one-half silver. Mr. K. designs starting back to Ely in three or four days with a load of drills, picks and all kinds of mining implements. Another man says there is but one good mine yet developed, and that the nearest water is seven miles off.

Other Outside Districts.—Reports from Kern are particularly favorable.... In Reveille there are fifty miners, and each has a few tons of rich rock piled up.... Sierra is a new district adjoining Eureka on the south ...In Cooper, the Mollie Ruter is turning out very rich ore....Eureka men say that that district will be the place for poor men as soon as it gets mills.

Oregon.

Baker County Mines.—La Grande *Sentinel*, Feb. 19th: Mr. Atkeson reports the prospects for a good mining season to be very flattering. The snow on the mountains is considerably deeper there than here.

The mines at Pocahontas are reported to be opening up very rich.

San Francisco Mining Stock Market.

MINING SHARE MARKET.

The increase in the transactions at the Board during the past week has been quite large, exceeding the sales for a like period for some time past. Prices have been well maintained by a majority of stocks offered, while the decline toward the close, occurring in a few leading stocks, among the rest, has not been very heavy, if we take into consideration the amount of shares upon the market. The present buoyancy is thought to be the prelude to an active spring trade, in a general range of stocks, including outside as well as Board operations.

The sales in the San Francisco Stock and Exchange Board during the month of February, for the past five years, amounted to the following sums:

In 1866	$3,752,292
In 1867	3,303,520
In 1868	9,716,596
In 1869	6,818,644
In 1870	3,139,433

The Sutro Tunnel Company elected the following Trustees: Samuel Merritt (President), Michael Reese (Vice President), Abraham Seligman, Henry Barroilhet, John B. Felton, Joseph Aron, and William H. Sharp. J. Seligman & Co., bankers, were elected Treasurer. W. K. Van Alen was appointed Secretary and General Agent.

From the *News* (White Pine) of the 7th, we clip the following: "The intermittent storm of the past week greatly retarded mining matters, more by discouraging those about to commence work on hitherto idle mines, than by any actual check to active operators. We noticed on Friday morning a number of mines about being opened on foreign capital; this class of owners are more particular about the season than those who have resided here for a year or two, and the return of storms after the fine weather of February, is likely to deter them from commencing as early as they intended. However, a large number of mines, both base and free, have been started up—more especially of the latter class, most of which are located on Treasure Hill. In consequence of this there is a noticeable improvement in the local business of Treasure City. English capital is seeking investment here, and a representative engineer is expected daily, to make examination of several leading mines on Treasure Hill, with a view to purchasing them in bulk. Five leading mines are included in the negotiations, and the price agreed upon goes well up into the millions. Our bullion shipments for the past week show a considerable falling off from the week previous, aggregating but $19,130 55—of which $10,559 32 went West, and $8,571 33 East. The shipments for February foot up $111,901 33—of which, $60,843 57 went East, and $42,057,82 West. Excess over shipment for January, $6,455; and over a corresponding period of last year, $70,243 96."

Chollar-Potosi—was in the market to a considerable extent at an advance. During the week ending March 4th, 1,120 tons of ore were extracted, against 1,220 tons the previous week. In the Grass Valley Tunnel they are cutting bodies of ore as the tunnel goes eastward, and it is expected that in about thirty days from this time they will commence extracting this ore. From present appearances, the yield of ore for March will exceed that of February, both in quantity and quality. In the drift running west from the new shaft water has been reached, which interfered with their progress; however, 36 feet were added to its length during the week under review, making a total length of 280 feet. The bullion returns for the month of February foot up $91,545; in January to $115,253. A dividend of $1 per share is payable since the 10th inst.

Savage—was not quite so active as during the previous week, and sold at a recession. The bullion receipts for February only amounted to $7,035; in January they aggregated $25,560, and in December $31,570.

Gould & Curry—was in request at a sharp advance, rising from $140 to $200 per share. They extracted 358 tons of ore during the week closing the 7th inst.; previous week 253½ tons. No correct estimate can be given of the amount of ore existing in the present developments of the upper mine. In the northwest drift from the seventh station the rock is hard and progress slow, and up to this writing nothing resembling precious metals has been met with either in the north or northwest drifts. Amount of bullion received during the month of February, $33,389; in January, $18,239.

Hale & Norcross—was moderately dealt in, a decline taking place just prior to the disbursement of the dividend. For the week ending March 5th, 298 tons of ore were taken from the upper mine, and 729¼ from the lower—sixth level—making a total of 1,027¼ tons, against 1,002¼ tons the previous week. On hand at the dumps, 3,372½ tons. They have reached the west wall in the west cross-cut on the sixth level, which extends to the northern boundary, and have ascertained that the ore is 14 feet wide, the average assays showing $49 21 to the ton. Some twenty feet south of this cross-cut another cross-cut was carried from the east vein to the west vein, a distance of 76 feet, and this drift has now penetrated the west vein six feet. This ore is low grade, assaying from $19 to $23, but they expect to find good ore in this vein, as in the cross-cut carried through it on the level above, the western portion exhibited good ore, about 10 feet wide. The shaft has been sunk 34 feet below the sixth level, and they have encountered streaks of ore similar to that found east of the east clay on the level above, north of this point. A dividend of $5 per share is payable since the 10th inst. The bullion product for February aggregates $145,171; in January it amounted to $188,334.

Overman—improved during the past week, and changed hands to a considerable extent. During the week ending March 6th, 834 tons of ore were extracted, as follows: Upper tunnel, 422; lower, 320; 500-level, 92 tons. The bullion returns for February foot up $57,613; in January $49,229 were received.——Sierra Nevada shows a bullion product of $12,800 during the month of February. ——Crown Point reports a bullion product of $14,719 for February.——Kentuck declined rapidly. From upwards of 400 tons assorted ore they obtained about $19 to the ton.——Imperial rescinded assessment of $10 and levied another of same amount on the 7th inst.——Ophir levied an assessment of $3 per share on the 7th.

Amador (Cal.)—is increasing in value and is firmly held, small sales having been effected at $350 per share. Deducting the dividend of $10 per share, payable since the 8th inst., they will carry over a surplus of more than $40,000, which is a larger amount than they carried over the previous month.——Eureka, (Cal.) another of the valuable California gold mines, disbursed its usual monthly dividend of $7 50 on the 7th inst.—*Commercial Herald*.]

San Francisco Prices of Copper Ores.

San Francisco, March 9, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

Cleveland is digging a tunnel a mile and a quarter long under Lake Erie for fresh water. The hole is so small that only one man can work at a time at the end, and the clay is so very compact that it requires to be dug out by the fist-full with a pick. A crib will be sunk in the spring and work carried on from the lake end, the calculations of the engineers being so delicate as to enable the two parts to meet.

To supply food for the inhabitants of the British Islands, there were imported during the year 1868, 54,484,758 centals, (or 120,055,390 bushels) of cereals. This was divided as follows: 38,032,444 centals of wheat, 7,475,284 of corn, 8,112,553 of oats, 11,472,225 of maize, and 391,801 of rye and buckwheat.

The Nile has risen this year to a greater height than on any occasion within living memory. The damage is about 200,000,000 francs.

A London Omnibus Company carried 20,000,000 passengers during the first six months of 1869.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Interesting Wheat Experiments in Butte County.

The monthly agricultural report for January gives the result of some interesting experiments in wheat raising, communicated by General Bidwell, of Chico, Butte county. It appears that something over a year ago, General Bidwell received several packages of wheat from the Commissioner of Agriculture, which he sowed, with the following results:

Tappahannock, 46½ pounds, sowed at the rate of 44 pounds to the acre, yielded at the rate of 21.96 bushels to the acre.

Rough Chaff, 7½ pounds, sowed at the rate of 30 pounds to the acre, yielded at the rate of 24.38.

Talavera, six pounds, sowed at the rate of 61 pounds to the acre, yielded at the rate of 34.18.

The land was a sandy loam, exhausted by ten or twelve years of constant cultivation, with but a little manure spread over it and plowed in. The sowing was late, and that and the harvesting was unavoidably committed to inexperienced hands, and hence the wheat was unevenly and thinly sown. General B's usual practice is, when planting early, to sow at the rate of about sixty pounds to the acre, and seventy-five pounds when sowed late. He writes that the later the sowing the more seed is required to the acre. His experience in that locality is, that if wheat is sown in November, 50 pounds is about the proper quantity; in December, 60; in January, 70; in February, 80, and in March, 90.

In the above experiments, if the sowing had been done early and in a proper manner, and had the season been favorable instead of the reverse, as it was, he thinks the result would have been about as follows: Tappahannock, 45 bushels; Rough Chaff, 60, and Talavera, 50 bushels to the acre.

With regard to the profitableness of these varieties of wheat, General B. thinks that they all will be a success here, but that the Tappahannock, notwithstanding its less yield, as above, is, everything considered, the best of the three. He will give it still further tests.

Some kinds of wheat, says General Bidwell, although very good, for a few years, soon lose their excellence; the grains becoming smaller and increasing in their proportion of starch. He instances the Sonora wheat, which, when first cultivated here, was plump, beautiful, and very productive; but it soon deteriorated, was discarded, and is now almost unknown. He does not allude to the Sonora Club wheat, which stands and yields well, but produces inferior flour. [Would the Sonora wheat have deteriorated, as described, if proper care had been taken in raising and selecting the seed?—Eds. Press.]

A New and Superior Melon.

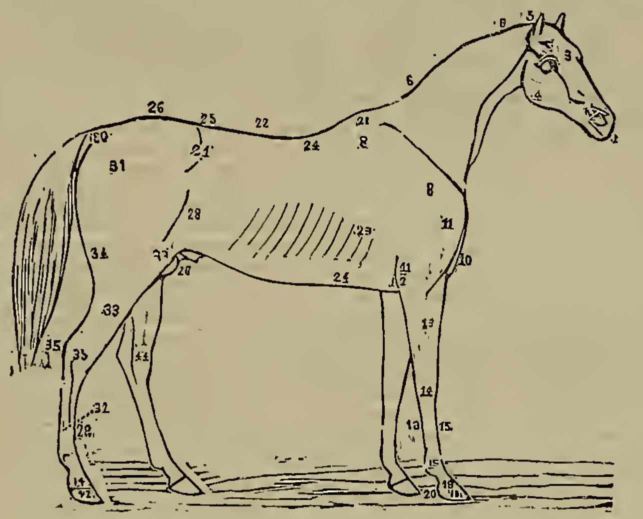
General Bidwell also received two varieties of oats, which he will report upon after the next harvest. He also received quite a number of different varieties of melon seeds, only one of which he reports favorably upon—the Cassaba melon. Of it he says: "This is a green-fleshed muskmelon, not remarkable for size. The rind, though not exactly green, does not change to yellow. The flesh is thick, soft, and juicy, but to properly describe it, is more than I will attempt. Melons may be more saccharine, but this is delicious, and, as nearly as possible, perhaps completely, defines the word *delicious!* and I would not exchange it for any melon ever before seen, or for all other melons combined."

A California Farmer who can raise five dozen eggs gets as much for them as a Minnesota farmer does for five bushels of wheat.

Points of a Good Horse.

We have been requested to give some information with regard to the "points" of a good horse. In order the more fully and clearly to comply with this request, we have had the annexed outline drawing engraved, illustrative of the form and external anatomy of this noble and useful animal. We do not claim that the engraving itself, represents our *beau ideal* of what a horse should be; it has been prepared merely to illustrate and aid the reader to more fully understand the annexed description:

In the construction of animal bodies, Nature appears to have two grand objects in view—utility and beauty. Every individual animal and each individual part thereof is evidently formed and fashioned after a most exquisite design, most clearly unveiling purpose and creative thought; and of all animals, man alone excepted, the horse is considered the highest and most perfect type. From the earliest days of written record to the present time, he has been celebrated in song and story, and has ever been the firmest and most useful friend of man.



ANATOMY OF THE HORSE.

1. Muzzle.
2. Nostril.
3. Forehead.
4. Jaw.
5. Poll.
6. Crest.
8. 8. Shoulder-blade.
10. Breast.
11. 11. True arm.
12. Elbow.
13. Forearm (arm).
14. Knee.
15. Cannon Bone.
16. Back Sinew.
17. Fetlock.
18. Coronet.
19. Hoof or Foot.
20. Heel.
21. Withers.
22. Back.
23. Ribs (forming together the barrel or chest.)
24. 24. Girth.
25. The Loins.
26. The Croup.
27. The Hip.
28. The Flank.
29. The Sheath.
30. The root of the dock or tail.
31. The Hip Joint.
33. 33. The Lower Thigh or Gaskin.
34. The Quarters.
35. The Hock.
36. The Point of the Hock.
37. The Curb Place.
39. The Back Sinew.
40. Pastern or Fetlock Joint.
41. Coronet.
42. Frot or Hoof.
43. Heel.
44. Spavin-place.

In Purchasing a Horse,

Regard should always be had to the use for which he is wanted; but for whatever use, care must be taken that he has a good body, and is full in the flanks. The front part of the chest—commonly called the breast—No. 10 in the engraving—should also be carefully examined; for a narrow-breasted horse can never have a good body, nor breathe freely. Beware, also, of a horse whose ribs are too much straightened in their compass; for horses which have straight ribs must of necessity have compressed chests, and when they are at the same time great feeders, they will often so much distend their bowels as to press them inconveniently on and below the lower terminals of the ribs. Such horses cannot travel or draw freely, and bear with difficulty the saddle-girth. When the breast is wide, the fore legs will be set well apart. Such a build is indicative of strength and endurance, especially if it is accompanied with circular and projecting ribs, giving a full chest or barrel, from No. 28 to 23. We see this point strikingly illustrated in the powerful draught-horse and in the bull-dog.

An approximately narrowing of the breast and approach of the fore legs, is a build which favors speed; but when this conformation is carried so far as to present a decidedly narrow breast and chest, and a flat-sided animal, both speed and strength are absent. The fore legs of such horses often interfere, occasioning sores or swellings on the fetlocks. These are points to be more carefully considered, perhaps, than any others, in selecting a horse.

The Head.

Next to the points already mentioned, we should look to the head—the seat of the brain. Without a wide forehead, we cannot expect a full development of the *faculties*—courage, tractability, good temper, sagacity, etc.—which are next in importance to the *physique* in an animal. A broad forehead (3) indicates a good brain. The Arab says: "The horse must have a broad, flat forehead, and the courage of a bull." It should also be wide between the ears, only moderately large, and expanding at the muzzle (1); the latter secures large nostrils—an essential requisite. The mouth of a young horse is round; it becomes narrow and elongated with age. A horse with a Roman nose is generally low-bred and ill-tempered—but not always. The true Arabian horse, however, never has a Roman nose.

A high-bred horse usually has a small head; such a head is characteristic of speed—it is also an evidence of fruitfulness. A large head is generally considered unsightly; but a moderately large head is essential to strength and endurance. A horse intended especially for work should not have a small head. By proper breeding, a large head may be made to show shapeliness, tractability and courage. A capacious throat and elegantly-curved neck are important essentials. The ears should be of medium size, not too small or over large. They should not be lopped. The eyes also form a very important feature in the horse. Few can have failed to have observed the difference of expression of the eyes of a racer or blooded horse, and those of a low-bred working horse. The bold, decided brow, and beautiful gazelle eyes of the former, present a most striking contrast with the inexpressive orbits of the latter.

There is much in the general expression of the head—the countenance—if we may be allowed the phrase. To persons not conversant with horses, the endless variety in this respect is almost incredible. Observe carefully a company of cavalry in line, and you will find almost as much evidence of individuality in the *animals* as in their riders. Irrespective of colors, no two will be found alike, and yet every peculiarity of expression will be indicative of some important property or propensity. An ill-visaged, bad-tempered *looking* horse should be avoided.

It is a common custom with English horse fanciers, when they wish to select, with great care, an animal from a large stud, to have each one brought, in succession, to a small open window of the stable, where the head, only, of the animal can be seen, in order that the expression or countenance may be first studied, apart from all other qualities or considerations. Afterwards the animals are leisurely surveyed for their physical characteristics. *Horse Physiognomy* is made a special study by English veterinarians and by many "horse fanciers." It seems to give a peculiar discriminative knowledge and insight into the propensities and qualities of the horse, which can be obtained in no other manner, except by long, personal acquaintance with the animal.

[Concluded next week.]

Castor Oil Bean Experiments.

A gentleman near Centerville, in Alameda county, who has had considerable experience in the cultivation of different varieties of the castor oil bean, informs us that he prefers the more hardy varieties, which withstand our winters and become perennial. By thus becoming trees, they require but the first planting, and very little after-cultivation. The beans contain a larger percentage of oil than those which have to be planted every year, as the chief effort of the plant is directed to maturing its fruit, very little increased plant fiber being formed or required.

The variety cultivated by our informant differs materially from those usually cultivated, in not scattering its seeds by the beans "popping" out, as described in our last issue. The pods, instead of bursting when ripe, hold the beans fast for a long period, giving ample time for gathering at leisure—a very great advantage. The beans are easily separated from the hulls by a machine similar to a corn sheller, which "rubs" them out.

The gentleman alluded to, first planted his beans two by four feet apart, and gathered 1,000 pounds of beans per acre the first year. The second year he thinned out one-half the plants, and obtained 1,200 pounds. The third year he left the plants four by eight feet, and gathered 1,500 pounds per acre. The fourth year he removed another portion, leaving the trees eight by eight feet each way, and harvested 2,000 pounds to the acre! The advantage of open culture is thus plainly demonstrated. Much of the increased yield is no doubt attributable to the fact of the plant becoming a perennial. Of course, the plants, in taking on the tree form, would require more room than when planted every year and their growth necessarily confined to a small bush form.

These trees are now five and six years old—fine spreading trees, ten feet high and six to eight inches diameter at the butt.

As a speculation, our informant does not regard his experiment as a very largely paying one, but thinks that with a steady and reliable market it would be profitable among other farming industries.

One or two of these trees present an elegant ornament in a front yard. Their beautiful leaves and fine pyramids of clustering cones of beans are superb. It is frequently stated that castor oil bean plants are disagreeable to gophers, and will drive them away from the grounds. Our informant refutes the notion, and says that the gophers have actually destroyed many of his plants by eating them entirely off below the surface of the ground.

Yaupon and Mate.—Prof. H. E. Colton considers the North Carolina tea plant, or Yaupon, and the Paraguayan tea plant, or maté, to be nearly allied; in fact, to be the same thing, altered by climate and soil. He calls the first *Ilex Cassena*, while the other is *Ilex Paraguayensis*. He believes that Yaupon tea might be made a source of great revenue to the South, and suggests that if the people will not take hold of the matter, Northern capital will occupy the field. He contributes an article to the *Scientific American* upon the subject.

A man may fleece his sheep, but not his land. The farmer's game is "give and take."

More About Alameda.

Along the gently sloping valley that borders on San Francisco bay, whose waters mirror upon their glassy surface the ever-changing sky—now gray with morning light, now dazzling with mid-day or mellowed in harmony with evening tints and shades—where gaped here and there with deep ravines that send across the valley to the sea the tree-fringed streams, the green-clad hills roll up their massive folds against the sky, the traveler passes over a fertile plain of generous soil, past gardens, farms and orchards, villages and schools,—a picture framed by Nature, and glowing with the arts of man. The rugged hillsides sown with grain; the waters furrowed with many a craft; the puffing engine's track; the highways worn with hoofs and wheels, present a busy scene of constant life and varied enterprise. Although this is in area the smallest part of Alameda county, it is, nevertheless, the most important, and one of the garden spots of the Pacific coast. At Hayward's, a village of hotels, I turned aside into the hills through

Castro Valley,

A little gem, nestled in the hills, whose gradual slope, inviting the farmers' plow, is dotted with happy, prosperous homes. The principal enterprise here is grain-growing, although gardening, dairying, and other industrial branches would pay better, if added to the former. I noticed one thing here which will yet become famous,

The Gum Tree Ranch,

A piece of ground consisting of fifty acres, and planted with the *Eucalyptus*, in rows eight feet apart each way, making a forest grove of about 39,000 trees, set this season, with one year old seedlings of the *blue gum* and *iron bark*, the most vigorous and tall-growing varieties of the *Eucalyptus*. This tree is a native of Australia, and is as yet little known in California. The largest of these trees which I have seen are but five years old, erect, straight, vigorous growth, and fifty feet high. They are elegant ornamental trees, somewhat resembling the laurel, but more majestic and massive in figure and foliage. They are hardy throughout the lower hill and valley country of California, and are the most popular street, shade, and ornamental trees now attracting attention here. They appear to be very healthy trees, and their peculiar flavor and fragrance being disagreeable to animals, keeps them from being eaten or gnawed. Hence the gum trees can safely be set where other sorts of trees would be destroyed. The past winter has been severely frosty, but not one of the tender little trees in this grove has been killed. Although some persons regard this as a rash experiment, I have every reason to believe that it will prove a magnificent success. I have not seen the proprietor, but I fully appreciate the enterprise. The wood of the eucalyptus tree is hard, and the timber is said to be very useful for many purposes.

No country in the world is better adapted to the vigorous and rapid growth of many sorts of hard-wood timber trees than California, and nothing is apparently more needed than the planting of forests of such trees here.

The timber of several varieties of nut trees is also very superior; and what would be better than a large forest of all sorts of nut trees? The fruit alone would warrant the undertaking.

A Suggestion.

If extortionists and land monopolists could be induced to see some advantage in an enterprise of this kind, it would be a good thing. They might dispose of a part of their land to improve the balance, and at the same time mitigate the miseries of a selfish life by leaving some prospect of good behind. Now that the trans-Atlantic railroad is finished, we have ready means of procuring all sorts of trees direct from the East. Seedlings or young trees are the best to bring here. The freight would be but a trifle on each thousand, while their value, when fairly growing in our soil, would be immense. Many of the sheltered ravines among the hills, now of but little value, would be better than gold mines, if planted to forests.

Squirrels.

While riding through the hills I was surprised to see so many of these little rodents. In many places the sidehills are honeycombed with their burrows, and grass and growing things are kept close shaved. The valleys are troubled enough with them, but the hills are fairly overrun with these plump, lazy, saucy little animals, that eat up the fat of the land. The farmers appear to be puzzled to know the best means of getting rid of these pests. The boys all advocate shooting them, while the sober father mixes strychnine or phosphorus with wheat, by the bucketful, and leaves it scattered where the squirrels may eat it; but the little rogues appear to dislike or suspect it, though many eat and die.

Another Suggestion.

If some scientific man would invent an economical and practical combination of radical poison with some ingredient that would be enticing to, and readily eaten by the pests, he would confer a lasting benefit to the farmers, and make a fortune besides.

The Amador and Livermore Valleys

Lay before me when I reached a little town, suggestively named Dublin. The spreading fields and circling hills shone *emerald* in the glowing day. Here grain raising is farming, and farming is grain growing—on every sort of soil, adobe, sandy, gravelly, level and hillside. When farmers learn the capabilities and adaptations of their soils—learn that a diversified culture is more profitable, is safer, and more economical of time and money than one eternal thing, and that alone—it will be better for them. I do not object to wheat culture, but it would improve the condition of our farmers if they would look after their own interests, by producing what they consume and having more stock, or better stock, to consume something of what they produce.

Grape Growing.

I am very favorably impressed with the idea that grapes would succeed finely along the hills sloping to the sun. A very perceptible difference is felt in the air here and that along the bay. The hills which intervene break the cool, damp sea breezes, and so obstruct their moisture that the air here feels dryer, and the sun gives his full radiance to the warm soil. Many of the showers that drench the slopes along the bay, are dispersed among the hills and leave the grain to suffer here. Indeed, before the late rains, the farmers began to despair of raising anything. Now their hopes are fresh as the fields of growing grain—they have been made happy by the rain.

There appears to be a certain medium between the moist winds and the drying heat of summer, most suitable to the perfect growth and maturity of the grape. Los Angeles is not far from the sea, but gets the full heat of the sun as well as the occasional moisture of sea air. Her grapes are unsurpassed.

In all places where the hot dry breath of constant drouth prevails through the summer, grapes are small but very sweet. Where a surplus of moisture and cool winds prevail, they are sour, and mildew. I am constrained to think that the sunny slopes of the hills, through the eastern part of Alameda county, are admirably adapted to the culture of the grape.

But very few grapes have been planted in this section, and those were not placed in very favorable locations. Mr. R. Livermore and Mr. J. Neal have planted a few vines, and feel encouraged with the trial.

Much of the rich hill land has never been cultivated at all, and was not considered fit to cultivate until lately. Now, settlers are covering everything. Unsettled titles hang like vultures' wings over the homes of many. The settlers fear to make permanent improvements, while outside claimants are pretending to own the whole country. This state of things has too long retarded the progress of many of the best spots in the State; has caused heartburnings and deadly enmity, squalor and ruin, where happy homes and enterprise, and schools and prosperity, and good will should rule and bless and elevate society. And what is, if possible, still worse, parties that might and should quickly and justly settle such disputes, like vultures, feed upon the gore of agonizing hopes and bleeding purses, while right is disregarded. S. H. H.

What I Know of Farming.—No. 8.

Growing Timber—Tree-planting.

We condense as follows from Mr. Greeley's eighth article under the above head: Mr. G. thinks that one-fourth of small farms should be devoted to fruit trees; and one third of those exceeding 100 acres. This is more particularly for a rough rocky country like New England; but the proportion of timber should not be greatly decreased even in prairie States.

The reason for poor farming and meagre crops is everywhere assigned to "too much land"—that is, too much for their capital, stock and general ability to till effectively. It would cost but little to increase the extent of forest, while the profits therefrom would be much greater than for a continuation of poor tillage. Two-thirds of our farmers would improve their circumstances and incomes by concentrating their efforts, means and fertilizers upon one-half or two-thirds of the area now cultivated.

Mr. Greeley devotes several paragraphs in urging this practice and in calling attention to the existing state of things in the neighborhood of his own farm and other localities near New York.

Were the rocky crests and rugged acclivities of the country which have been denuded of their timber once more covered with a forest growth, and kept so for a generation, our floods would be less injurious, our springs unfailing, and our streams more constant and equable. Our blasts would also be less bitter, and our winds less destructive to fruit, etc.

Mr. G. believes in *cutting* as well as *growing* trees. He would, therefore, cull out the worthless trees for fire-wood, and for every tree taken away two better ones should be set out.

We have pretty well outgrown the folly of letting every apple tree bear such fruit as it will. At the present time every farmer realizes that he *can't afford* to grow little, gnarly, villainously sour or detestably bitter-sweet apples, when, by duly setting a graft at a cost of two dimes, he makes that identical tree yield Greenings or Pippins as bounteously. The cumulative experience of fifty or sixty generations of apple-growers has ripened this conclusion. Why do they not infer readily and generally that growing indifferent timber where the best and most valued would grow as rapidly, is a stupid, costly blunder? It seems to me that whoever has attained the conviction that apple trees should be grafted ought to know that it is wasteful to grow red oak, beech, white maple, and alder, where white oak, hickory, locust, and white pine, might be grown with equal facility, in equal luxuriance, provided the right seeds were planted, and a little pains taken to keep down, for a year or two, the shoots spontaneously sent up by the wrong ones.

North of the Potomac and east of the Ohio, and in limited districts elsewhere, rocky sterile woodlands, costing $2 to $50 per acre according to location, etc., are to-day the cheapest property to be bought in the United States. The parent who would invest a few thousands for the benefit of children or grandchildren still young, may buy woodlands which will be worth twenty times their present cost within the next twenty years.

But better than this would it be to buy up rocky, craggy, naked hill-sides, and eminences which have been pastured to death, shut out the cattle, scratch over with plow, or pick, plant thickly with chesnut, walnut, hickory, white oak, locust, etc.

Plant thickly, and of divers kinds, so as to cover the ground promptly and choke out weeds and shrubs, with full purpose to thin and prune as circumstances shall dictate.

Many farmers are adverse to planting timber, because (they think) nothing can be realized therefrom for the next twenty or thirty years, which is as long as they expect to live. But this is a grave miscalculation. Let us suppose a lot of ten or twenty acres rudely scratched over as I have suggested, and thickly seeded with hickory nuts and white oak acorns only: within five years, it will yield abundantly of hoop-poles, though the better, more promising half be left to mature, as they should be; two years later, another and larger crop of hoop-poles may be cut, still sparing the best; and thenceforth a valuable crop of timber may be taken from that land; for, if cut at the proper season, at least two thrifty sprouts will start from every stump; and so that wood will yield a clear income each year while its best trees are steadily growing and maturing. I do not advise restriction to those two kinds of timber; but I must insist that a young plantation of forest-trees may and should yield a clear income in every year after its fourth.

But this paper grows too long, and I must postpone to the next my more especial suggestions to young farmers with regard to tree-planting.

Singular Surgical Operation on an Ox.—At a late meeting of the St. Louis Farmers' Club a gentleman related the following occurrence which came under his observation, in 1852, in the town of Alabama, Genessee county, N. Y.: "An ox broke into a field of corn during the night in the month of September, and ate immoderately of green corn. It was believed he would die from the effects; its suffering was such as to cause groans most piteous. The owner, Mr. Lyman Prindle, resorted to the use of the knife, with a view to present relief than permanent cure. The incision was made from about four inches of the back-bone and back of the last rib, but in a line with it, and long enough to admit the hand into the pouch or stomach. The animal never flinched, but, on the contrary, ceased to groan. Mr. P. took out fully two-thirds of a bushel of the corn, consisting of young ears mostly. The heat was very great. The ox was left easy, but with no expectation of recovery, in which we were all mistaken; for in less than one week it was so far recovered as to frolic among the other stock to such extent that Mr. Prindle concluded he could work as well as play, and he yoked him and finished his fall plowing, finding him to endure the heat and labor as well as ever. The orifice, I should say, remained open for some months, allowing free ingress and egress of air, which was observable at some distance. Whether it would have been better to have closed up the incision by stitches is uncertain. I doubt not it would have been done at first had it been considered possible for the animal to live."

Don't Feed Dirt to Your Cattle.—Some farmers are in the habit of feeding potatoes, turnips, and other roots to cattle, with a large amount of earth clinging to them. When eaten raw, the cattle will contrive to avoid eating the dirt as much as possible; but in cooking unwashed roots, the earthy matter is generally so mixed up with the food as to preclude the possibility of any separation by the animal in the process of mastication. This is a bad practice. Dirt is not only non-nutritious, but highly injurious when taken into the stomach of animals in any considerable quantity. This is especially the case with swine.

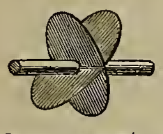
Notices to Correspondents.

Austin Friends.—The object of the Loud-Cole invention is to provide an improved device for propelling vessels, and consists in the employment of two circular disks or rims mounted obliquely and in different directions, upon a shaft. It is claimed that the action of the wheel approaches nearly to that of the tail of a fish in its effect, or that of an oar when used in sculling. The accompanying cut gives the general idea of the patent, but a rim or wheel may be used as well as the disk.



D. S. N. sends us a request with regard to the highest rate of speed attained at the snow-shoe races in Sierra county. Accounts have appeared at some previous time in the *Mountain Messenger*. Will the editor of that paper please give us some facts as to the fastest time made, and the character of the ground over which the races were run?

Chloride Bill, Humboldt City, Nevada. We cannot notice communications which make statements without giving the real name of the writers.

Steam Plowing by Direct Traction. The English are experimenting upon this with Thomson's road steamer. At a recent trial, a single plow was drawn by it at the rate of six miles an hour. This speed was, however, too fast for the men holding the plow, and had to be reduced. The furrow was well and evenly turned. It was one of these steamers to which we alluded, a week or two since, as being on its way to California, to be used on the reclaimed tule lands of Sherman and other islands in the Sacramento river. These lands are of such a soft and spongy nature that they will not admit of the passage over them of a locomotive steam plow in one machine. By separating the plow from the locomotive, steam plowing will undoubtedly be made a success on our tule lands. The plows to be used will be constructed with knives for cutting, instead of with ordinary plows for turning a furrow. The latter cannot be successfully employed of such lands.

◆

Climate of California.—We are obliged to defer to next week the report of a very interesting paper read before the Academy of Science by the president, Dr. Blake. We shall give it in our next issue.

A New Gold Fever.

The reported discovery of exceedingly rich gold mines not far from San Diego has caused a tremendous *furore* in that and neighboring districts, and a general stampede to the locality of the mines. Some of the ore has been brought to San Francisco, and has given rise to considerable excitement in this city.

Exaggerated reports, as usual, reach us, but still apparently there is good authority for believing that very rich quartz has been found. We have seen several specimens, in which the crevices were bespangled thickly with the glittering metal, which, however, did not seem to impregnate the whole mass. We are always a little suspicious that such rock will not continue to keep up its yield, at least that has been our experience; and we note, in this connection, the report that, at only a very small distance from the surface, silver occurs.

The location is 2½ miles from the mining camps of the Coleman district, near the headwaters of the San Diego, within half a mile of the summit of the ridge forming the watershed between the San Diego valley and the desert. It is about 60 miles from San Diego by the wagon road, and 54 miles northeast of Point Loma. The formation is given as talcose slate, which extends for miles and disappears in the desert; to the west it gives place to granite, into which the veins are said to extend (?). The discoverers located 4,400 feet on the Geo. Washington lode, and two other locations had been made, covering in all over two miles. The ledge is two to four feet wide, but no one has sunk over six feet. The quartz is free from sulphurets, which, however, proves nothing, as this is to be expected so near the surface. The country is filled with fertile valleys, grass is abundant, and there is considerable timber.

Besides the first lode, another (and a richer still) is reported to have been found. Hundreds of men are on the ground, locating and jumping claims, and the region will undoubtedly be thoroughly prospected. We hope that the miners will have profited by their former experience, and that the region, if it turns out as is thought, will give rise to legitimate operations, and not to mushroom swindles and gigantic stock operations.

◆

Largest Pumping Engine in the World. The three pumping engines employed in keeping dry the Haarlem lake, in Holland, are noted by the New York *Engineering and Mining Journal* as being the largest in the world. They are each of 500-horse power. The cylinders have an interior diameter of twelve feet, with ten-feet stroke. The "Leeghwater," the first one built, drives eleven pumps of sixty-three inches diameter each, all moving at the same time, and attached to the upper part of the piston rod by means of huge walking-beams The cylinder is placed in the center of a circular building or tower of masonry, standing in the lake near the shore. The walking-beam projects through equi-distant openings in the tower. The three engines discharge two millions of tons of water in twenty-four hours.

◆

A Pioneer Enterprise.—A Weyer, proprietor of the Paris Scouring and Blanket Cleaning Works, at No. 1719 Powel street, was the first to introduce that special branch of industry on a large scale in this city, and we are pleased to learn that he is now meeting with great success. It is a real saving to our citizens (and those in the country who can readily send by express) to patronize his works. His advertisement mentions quite a number of articles entirely impracticable for the best of housekeepers to clean, owing to the liability of injury to the goods by inexperienced hands.

Our Home Industries.

Ice-Making.

In no other country is so much ice consumed as in the United States. The American must have his ice-water in winter and in summer, while in other countries this is demanded to no extent except in warm weather. Consequently, we hear more of ice-machines and ice-houses in America than elsewhere. We have published, of late, at different times, various freezing recipes and accounts of many ice machines, and this week we give an account of the Egbert process, as used by the Summit Valley Ice Co. It is from a communication sent us by Mr. T. McAnley:

Editors Press:—My promise to give you an account of the practical working of the making and storing of ice by the process as described in the claim in the "Egbert Patent," obtained through your office nearly two years ago, is not forgotten—but only delayed in fulfilment until now, in order that I could say what *has* been accomplished in place of what we *expected* or *hoped* to accomplish.

After obtaining the patent in the fall of 1868, I decided on Summit Valley, on the line of the C. P. R. R., within three miles of the great Summit tunnel, as the place for the first or experimental ice-house. The requisites for a suitable location being an unfailing supply of pure water, facilities for transportation of ice to market, and the indispensable requisite of *some* freezing weather, which is of much rarer occurrence, even on the very summit of the Sierra Nevada mountains, than most Californians suppose. For, although it is not unusual to have twenty to twenty-five feet in depth of snow, it is very unusual to have twenty-four hours of freezing weather at any one time during the most severe winter months, on or west of the summit. It seldom if ever freezes, except in the shade, and with the wind from northeast.

Temperature of Summit Valley.

The thermometer at this place last winter, from December 25th to March 5th, averaged (in the daytime) forty-four degrees, or twelve degrees above the freezing point of water, while at night, for the same time, the average was twenty-five degrees, or seven degrees below the freezing point. The coldest nights—January 15th and 27th—the thermometer stood at ten degrees above zero; January 21st, nine degrees above; February 4th, 5th, 6th, 17th, 20th, 21st and 25th, at 12 degrees above; February 22d, 11 degrees above; being from 20 to 23 degrees below the freezing point of water. The warmest days being—

Dec. 29,	at	noon	........45°	Feb. 8,	at	noon	........45°
Jan. 9,	"	"	........43°	" 17,	"	"	........45°
" 13,	"	"	........48°	" 18,	"	"	........46°
" 22,	"	"	........46°	" 28,	"	"	........60°
" 31,	"	"	........52°	Mar. 4,	"	"	........62°
Feb. 1,	"	"	........50°	" 5,	"	"	........54°
" 2,	"	"	........46°				

Or from 13 to 22 degrees above the freezing point of water.

This winter, from November 24th to the present time (February 10th) average (during the day) 37 degrees above zero—or five degrees above freezing. For the same time at night, average 26 degrees, or six degrees below the freezing point of water. The coldest nights being—

Nov. 27	......16°	above	zero	Jan. 6	....16°	above	zero
Dec. 18	...... 8°	"	"	" 16	......16°	"	"
" 19	...... 5°	"	"	" 17	...... 4°	"	"
" 20	......10°	"	"	" 24	......14°	"	"
" 21	...... 8°	"	"	Feb. 6	......13°	"	"
" 22	...... 6°	"	"	" 7	......16°	"	"
Jan. 1	......16°	"	"				

Or, from 16 degrees to 28 degrees below the freezing point of water.

During the whole time (from November 24th to February 10th) there were but 18 days in which the thermometer did not rise above the freezing point, and but five days that it did not go above 30 degrees, and but one day that it marked below 20 degrees at noon.

From this it will be seen that the climate of California in the most favorable location is not well adapted to the making of ice on an open lake or river.

It was for the purpose of overcoming the disadvantages of climate and utilizing what freezing weather there is, that our process was devised and put in execution.

The Ice-House.

Having indicated the peculiarity of climate to be contended with, I will now describe our ice-house and fixtures and the manner of operating. The experimental house (built last year) is 76 feet long, 20 feet wide and 20 feet from floor to joists, the pitch of roof leaving 10 feet clear between rafters and joists at center of building. We got water into the building on the 7th of January, 1869, and succeeded in making about 500 tons of ice between that and the last day of February, and should undoubtedly have filled the house within the next two weeks, only for an accident to the water pipe at that time, which prevented us from getting any more water into the house. Being thus encouraged, we built last summer in addition to the old house, a new one, 162 feet long, 40 feet wide, and 26 feet high from floor to joists, the pitch of roof giving an 8-foot space between joists and collar beams, and another 7-foot space between collar beams and rafters. A flooring laid on the collar beams gives access from the inside to ventilator doors in the roof on each side of the combing, while 12-inch plank laid parallel with the joists and midway between them (the joists being three feet apart), supported by bridgetrees between the joists, give free access to all parts of the building above the joists and the room for the ice. The lower floor is only loose boards resting on sawdust spread on the ground just thick enough to insure drainage. The side-walls of the building are made double; the studding, which stands three feet apart, is boarded up on both sides and the spaces between filled in with sawdust. In every other space between the studding are left openings, 2½ feet wide by seven feet high, which are opened or closed at will by means of double doors in each. The opening of these side doors near the ground, together with the opening of the ventilators in the roof, secures a steady draught of cold air through the building during the night, or, whenever the temperature is below the freezing point, thus making of the house a powerful refrigerator. The closing of the doors and the ventilators in the roof, when the temperature is above the freezing point, at once stops the influx of warm air from the outside and makes of the building a complete ice-house, and keeps from waste or damage all the ice made during the freezing hours of the night. And thus the doors and ventilators are opened or closed as occasion requires, from time to time, until the house is filled and the ice reduced to the lowest possible temperature the weather will admit of, after which they are closed and battened tight, to preserve the ice during the summer, as in any ordinary ice-house.

The joists of the building are three inches thick by twelve inches deep, and on the sides of each is spiked a board 1¼ inches thick by sixteen inches deep, so as to allow the lower edge of the board to drop one-half inch below the lower edge of the joist, to prevent the water from running back on the lower edge of the joist. The upper edge of the board extends above the joist 3½ inches, thus making a water trough or distributing sluice of each joist, which, being level and filled with water, and supplied with a constant stream from the main sluice, distributes the water over its sides equally, and from end to end of joist, or from side to side of building.

The Water Supply.

The main sluice, which furnishes water to all of the distributing sluices, runs through the center of the building from end to end, crossing the distributors at right angles and a few inches above them; three-fourth inch holes in the bottom of the main sluice, where it crosses the distributors, admit the water from the main to each distributor. The main sluice is supplied with water by an 8-inch iron pipe leading from the reservoir on the hill above the house, the pipe being covered out of reach of the frost. Tapered wooden plugs stop off or regulate the amount of water flowing from the main into the distributors, the surplus water pouring off at the end of the building from the main sluice.

[to be continued.]

◆

An Egg Substitute.—Messrs. Heathfield, Bogel & Co., 206 Battery street, are offering the public something entirely new in the culinary line—a preparation which answers the multifold purpose of eggs, baking powder, soda, saleratus, etc., alone, or in connection with flour. The article comes in the form of a powder, and is put up in cans, like yeast powder. It is said to be entirely free from all mineral alkalies, while at the same time it renders the food into which it is introduced light and wholesome. It is intended for use, however, only where eggs are required. It is especially recommended to miners. Try it.

A London Omnibus Co. carried 20,000,000 of passengers during the last six months.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING MARCH 1ST.

ROCK DRILL.—A. Blatchley, Central City, Colorado.

FOUNDATION FOR BUILDINGS.—Almond F. Cooper, San Francisco.

MANUFACTURE OF ARTIFICIAL FLOWERS.—Catherine E. Howard, San Gabriel, Cal.

MACHINE FOR FEEDING ORES INTO SHAFT ROASTING FURNACES.—Charles Stetefeldt, Austin, Nevada.

CURTAIN FIXTURE.—James Turnbull and William Turnbull, Vancouver, Washington Territory.

GANG-PLOW.—George R. Duval, Salem, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

GRIP PULLEY.—A. S. Hallidie, San Francisco.—This invention relates to an improved construction of that class of pulleys known as grip pulleys, which are employed more particularly wherever rope wire is used in transmitting power. The novelty of these consist in the manner of arranging the two gripping jaws or clips, so that they will be operated by the strain upon the rope, without the necessity of bolts, rivets, screws or other device for holding them in place. The rim of the wheel is made in two parts, one of which is formed solid with an arm, and of only half the desired thickness of the rim, so that it forms a shoulder. This is then bolted or riveted to the other part, thus forming a rim of the required thickness. The flanges, between which the gripping jaws or clips are placed, are simply spread apart in the ordinary manner of forming the groove in pulleys. At intervals around the entire grooved periphery of the wheel are cavities or recesses, placed opposite one another in the two flanges. These are made widest at the lower part. The clips or jaws are made with spreading arms, so as to admit the rope easily, and the corners extend into the cavities just mentioned, thus preventing their dropping out, while allowing of a slight motion to and from one another. A groove or space is made just below the point of meeting of the clips, so that when the strain comes on the rope or chain, which rests on the bottom of the groove between the two jaws, the central part of each clip will be depressed, thus causing the jaws to grip the rope and prevent its slipping, while the strain is on, but as soon as this is removed, the jaws will work freely in their sockets and allow the rope to open them, and thus free itself from the pulley. This invention, in which the jaws are operated automatically by the strain on the rope and their own weight, is exceedingly simple and effective, has no complicated parts to get out of order or break, and is cheaper than other kinds.

WHEELBARROW.—Henry Alter, Lakeport, Cal.—It has been remarked by travelers, that Americans are the only people who know how to make a wheelbarrow, the clumsy contrivances of other lands being so constructed as to throw a large part of the weight of the load onto the laborer's arms, thus rendering it impossible to carry such loads as are customary in our country. The present invention is designed to improve on our American patterns, and consists, first, in the peculiar construction of the front end of the timbers forming the handles in connection with the standards, so as to accommodate a peculiarly shaped bed or trough; and, secondly, in the manner of mounting the vehicle upon the wheel. This arrangement of the wheel and forward ends of the timbers causes the entire weight of the load to come upon the wheel, which is placed below the load, and thus the weight on the handles is taken off and the vehicle can be moved with greater ease than our common barrows. The inventor has originated several other very ingenious agricultural implements of considerable value.

BOAT DETACHING APPARATUS.—J. Ross, S. F.—This device is intended to render possible the instantaneous detachment of boats from the tackle, after lowering, and consists of two strong bent pins, one at either end of the boat, and each having at one end a loop or head, by which to attach a chain, while the other end extends through an eye at the bottom of the block and through another attached to the boat. The chains from the heads pass down to the bottom of the boat and along to the centre, where they pass around a sort of capstan or upright shaft, bearing a crank at the top and above the thwart, by which to turn it. When the boat is secured, a pin passes through the thwart, so that the crank bears against it and is thus prevented from turning. To detach the boat, the pin is withdrawn, and the axle revolves, unwinding the chain and allowing the ends of the pins to be freed from the eyes at the ends of the boat, after which they will both be drawn through the eyes in the blocks and the boat will fall into the water. The whole apparatus is very simple and is easily attached to any boat.

ROOFING AND FLOORING COMPOSITION. P. N. Mackay, Virginia City, Nev.—This is an improved composition for roofs, floors, pavements, etc., which is laid in a similar manner to the asphaltum pavement, and which secures ample protection against fire and water, and the troublesome intrusion of rats and mice, and "such small deer."

◆

AMERICAN LUXURY.—The Americans are accustomed to live much more luxuriantly than any other people, and what we are accustomed to consider, in many instances, articles of necessity, other nations hold as luxuries. In the matter of carpets, for instance, we indulge to a greater extent than other people. And, by the way, should any one desire to get a fine carpet, or handsome rugs, or lace curtains, or similar articles, we advise them to call on Messrs. Mitchell & Bell, 606 Clay street. This firm imports directly their foreign wares, and obtains from the factories the domestic articles, and is thus enabled to sell at a low price. For the politeness and attention of the proprietors we can vouch, for a customer happened in as we were in the store, and the room was speedily transformed into a parlor, or a dining room, or library, as the various patterns were exhibited. It will be remembered that Messrs. M. & B. furnished the "Washington Box" at the Musical Festival, and received the special thanks of Mme. Urso for their very kind and polite conduct.

◆

VENETIAN AWNINGS.—These articles, which add so much to the comfort of our rooms, in this warm sunny land, are manufactured in all shapes and sizes by J. M. Withers, at 120 Leidersdorff street. For elegance and comfort these are certainly highly to be recommended.

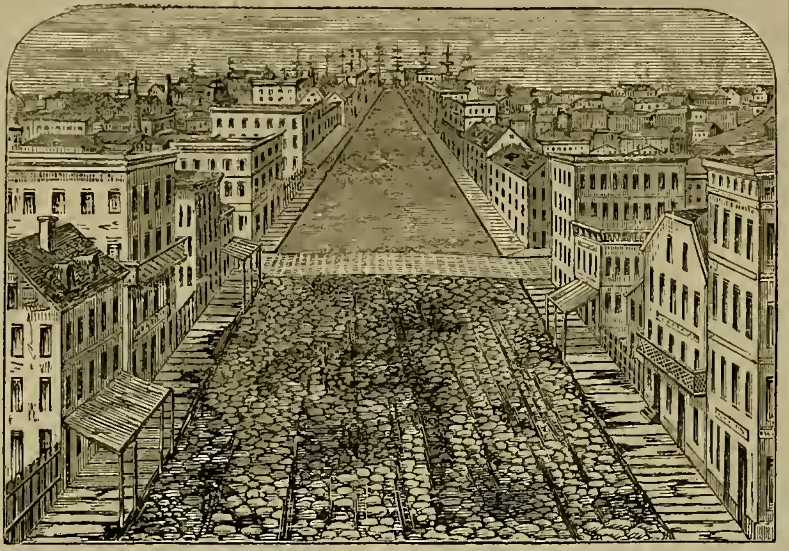

FIG. 3.—VIEW ON BATTERY STREET,

SHOWING THE WEAR ON THE COBBLE AND THE STOW PAVEMENT.

Report of Samuel S. Fisher, Commissioner of Patents, for 1869.

Growth of the Patent Office

Few persons realize the rapid growth of the office, and the annual accretion of material. The models increase at the rate of one hundred square feet per week, or five thousand square feet per annum. The drawings increase at the rate of seventy-two cubic feet per annum; the files at the rate of four hundred cubic feet; the printed specifications at the rate of four hundred and twenty-five cubic feet; the printed drawings at the rate of four hundred cubic feet; the books in the library at the rate of one hundred and sixty lineal feet of shelving, and the copyright books at the rate of one hundred lineal feet. There will be twenty thousand more cases to be examined this year; and, if the applications made in the present year should not exceed those of 1869, they will still add, with models and drawings, twenty thousand new cases to be inspected by the examiners of future years.

It must soon become a serious question to determine what disposition is to be made of the models. In a vast number of cases no such illustration is required, the inventions are so simple that they can be readily understood by good drawings. Models soon become broken and inoperative, and in some cases have been altered surreptitiously, so as to become false witnesses.

We may take just pride in our national museum of the mechanic arts, but it is questionable whether this museum can be allowed to grow at the rate of five thousand square feet per annum.

A remedy for the difficulty will probably eventually be found in dispensing with all models, except when, in the discretion of the Commissioner, such mode of illustration is absolutely necessary. This would relieve inventors of a very considerable tax, as the preparation of the model is usually the most costly part of the application.

It is also a question of serious consideration, whether the rejected applications should be used as references to defeat new applications. Many cases may have been rejected because the devices were impracticable and useless, because they in turn were anticipated by others. Since the rejection these cases have been kept in pigeon-holes not open to public inspection. The public has taken nothing by the description of the alleged invention, and probably in the great majority of cases the manufacture of the article has never been commenced. Such mere description or sketches of an invention not reduced to practice or made accessible to the public, but kept in the library of a private person, would not destroy a patent. It is not perceived that they should have this effect because the pigeon-hole in which they are entombed is in the Patent Office, rather than elsewhere.

To reject applications upon patented or published cases and pending application only, would probably protect the public from real injury as well as by the present system, while it would diminish the labor of the office in the work of examination fully one-third.

Otherwise, although the number of applications to be examined be the same from year to year, the work of the examiner is constantly increasing, since each year's accumulations are added to his portfolios. A gradual increase of the examining corps from year to year becomes, therefore, absolutely necessary.

◆

California Enterprise.

[Written for the Scientific Press.]

The *Bulletin* of March 2d published a memorial addressed by leading men of San Francisco to the Committee on Mines and Mining of the Senate of California, the object of which was to obtain "such State aid as will insure the early inauguration of the home production of iron and steel from the ores of California." To accomplish this laudable object, Mr. Maclay has introduced a bill to the legislature proposing to levy a tax of *one per cent. on every hundred dollars,* to pay interest at the rate of seven per cent. on $200,000 of bonds of the "Sierra Iron Company"—*vide Bulletin* of March 2d. What disposition they propose to make of the surplus we are not advised; no doubt there are some other little schemes to develop the resources of the State at the cost of the tax-payers.

Those who have not seen this memorial may desire to see the names of the signers who invoke State aid for such an insignificant amount. We refer them to the *Bulletin* of March 2d. At the same time we suggest to the press throughout the State that they publish this memorial with the names. If we mistake not, it will do more to attract the attention of men of capital and enterprise abroad to our great want than anything that has yet been done. Who signed this memorial? Nearly every man in San Francisco, prominent for his wealth. The signers number upwards of one hundred individuals and firms, including nearly all the bankers, money-lenders, speculators in real estate and mines, general and shipping merchants, etc., etc. Among the signers are men whose wealth is estimated at millions. Had they known what Mr. Maclay proposed, and what they were lending their influence to accomplish, we question whether their names would have been given. They are too expert in figures not to have discovered at a glance that by levying a tax of one per cent. upon *their own property,* they could raise more than the capital required, and, as a matter of course, their patriotism would have prompted them to do so.

Some years ago, our more enterprising neighbors of Oregon raised capital and incorporated a company; they erected, one, two, or more furnaces, and shipped parcels of their iron to San Francisco, which was distributed among our foundrymen, who pronounced it very superior, but, for some reason, we believe, not adapted for ordinary casting. It was stated that they could deliver their iron in San Francisco at about $45 a ton.

The questions for consideration are:

Has the Oregon enterprise proved a mercantile success?

If yes,—then can the Sierra enterprise hope to compete with it in the market of San Francisco and Sacramento?

If not,—then where will they find a market, unless where the farmers of Sierra Valley dispose of their produce—at *Virginia City,* and in that neighborhood?

Did all the signers of that memorial contemplate this, when they signed it?

The Committee on Mines, etc. will look over the list of names, and say, at once, there is no money in it, or it would not be here, did they require ten times the amount of capital mentioned. C.

◆

SILVER-PLATED COPPER AMALGAMATING PLATES are coming into very general use at the quartz mills throughout California, instead of the ordinary copper plates. One mill in Grass Valley now employs not less than ninety superficial feet of these plates. Mr. E. G. Denniston, of the San Francisco Plating Works, whose card will be found in our advertising columns, is doing a large amount of this work. We dropped in there, a few days since, and found quite a number of batteries at work, connected with one of which was a bath, in which were placed ten plates of copper, presenting an amalgamated surface of thirty square feet. Mr. D. makes the preparation of plates for miners' use a specialty, in addition to his general work for builders, plumbers, gunsmiths, etc. He makes use of the Smee battery.

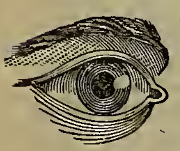
DR. ABORN,



Oculist, Aurist,

AND

CATARRH, THROAT

AND

Lung Physician.

No. 22 KEARNY STREET,

SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox. Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California

To whom it may Concern.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.
WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.
VINCENT MONATTI,
Corner of Dupont and Green streets.
San Francisco, Dec. 25, 1869. 7v20-3m

Somersville, Cal., August 25th, 186[illegible].

Messrs. Dewey & Co.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
Geo. Hawxhurst.

THE GREAT MEDICAL DISCOVERY!
Dr. J. Walker's California
VINEGAR BITTERS.
More than 500,000 Persons
Bear testimony to their wonderful Curative Effects.
WHAT ARE THEY!

FOR FEMALE COMPLAINTS, whether in young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient. PIN, TAPE, [and other WORMS, lurking in the system of so many thousands, are effectually destroyed and removed. ☞ SEND FOR A CIRCULAR.

They are not a vile
FANCY DRINK,
Made of Poor Rum, Whiskey, Proof Spirits, and Refuse Liquor, doctored, spiced, and sweetened to please the taste, called "Tonics," "Appetizers," "Restorers," etc., that lead the tippler on to drunkenness and ruin, but are a true Medicine, made from the native roots and herbs of California, FREE FROM ALL ALCOHOLIC STIMULANTS. They are the GREAT BLOOD-PURIFIER AND LIFE-GIVING PRINCIPLE, a perfect Renovator and Invigorator of the System, carrying off all poisonous matter, and restoring the blood to a healthy condition. No person can take these Bitters according to directions and remain long unwell.

They are a gentle Purgative as well as a Tonic, possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In Bilious, Remittent and Intermittent Fevers, these Bitters have no equal. For full directions, read carefully the circular around each bottle, printed in four languages—English, German, French and Spanish.

One Hundred Dollars will be given for an incurable case, provided the bones are not destroyed by mineral poisons or other means, and the vital organs wasted beyond the point of repair.

For Inflammatory and Chronic Rheumatism, and Gout, Dyspepsia or Indigestion, Bilious, Remittent and Intermittent Fevers, Diseases of the Blood, Liver, Kidneys and Bladder, these Bitters have been most successful. Such Diseases are caused by Vitiated Blood, which is generally produced by derangement of the Digestive Organs.

Cleanse the Vitiated Blood whenever you find its impurities bursting through the skin in Pimples, Eruptions or Sores; cleanse it when you find it obstructed and sluggish in the veins; cleanse it, when it is foul, and your feelings will tell you when. Keep the Blood pure and the health of the system will follow.

J. WALKER, Proprietor.

R. H. McDONALD & CO.,
Druggists and General Agents, corner Pine and Sansome streets, San Francisco, Cal., and 32 and 34 Commerce street, New York. 10v20-12t

☞ SOLD BY ALL DRUGGISTS AND DEALERS.

The Theory of Ore Deposits.

All explanations and theories on the formation of ore deposits are in the highest degree interesting to those whose attention is directed towards mining. Many ideas have been broached and discussed; but, in the great majority of cases, these have been founded on insufficient data, and have not been satisfactory in general. Among the theories on the formation of veins which have been worthy of particular attention, either from their own intrinsic value or the reputation of their authors, are those of *contemporaneous formation*,—the lodes were formed at the same time as the enclosing rock, or subsequently by a metamorphosis in the altered regions of the same; of *descension*,—by material which came from above; of *lateral secretion*,—by material which came from the enclosing rock; of *ascension*,—the matter came from below, either in a state of aqueous solution (by *infiltration*), in a gaseous condition or introduced by steam (by *sublimation*), or in an igneous-fluid condition (by *injection*). These various theories have been criticised and discussed for years. Those of contemporaneous formation and of descension have had no upholders since the time of Werner; the others, however, from examination of different localities, and from the researches of eminent chemists and geologists, seem to be all possible.

We have long felt the need of some book in English which should give some account of the various theories and of their grounds, and some general information with regard to the ore deposits in the various parts of the world. Such a book, and but one such, has existed, and has gone through two editions, but being in German, has remained up to the present time a sealed volume to most of our readers. We refer to Cotta's *Erzlagerstdattenlehre*. A graduate of Freiberg has, however, recently done a public service in translating this work.* The reputation of Prof. von Cotta is a sufficient guarantee for the work; and we may remark that the translator took the first degree at the Freiberg Academy in the geological examination, that the professor has lent considerable assistance by suggesting some alterations and additions, and, after revising the translation, pays the translator the high compliment of allowing this to be considered a new (the third) edition of his work.

The work is divided into two distinct parts. The first treats of veins and other ore deposits in general. It contains various definitions, a list of the minerals which commonly occur as ores, a classification of the various kinds of deposits, and it treats of their origin, formation, distribution, etc. It contains, in short, the results which are deduced from the examples which form the second or special part of the volume. This second part contains descriptions of the most important ore-districts of Europe, viz: Germany, the Carpathian countries, the Alps, Italy, France, Spain, Great Britain, Scandinavia and Russia.

The reputation of the author and his prefatorial endorsement of the translator's efforts are all that is required to recommend the book. Its perusal cannot but be of great interest and benefit to those intimately or remotely connected with mining, and we hold it as one of the most valuable books in our library. We can only regret the unavoidable absence of the translator while the book was in press, which resulted in quite a number of typographical errors. We hope the work will lead to a similar one on the deposits of our own country.

We would quote largely, but want of space prevents our giving but one extract, and that a short one. We take the last sentence of the concluding observation on the formation of lodes:

"Thus the formation of lodes shows itself to be not only possibly, but also probably, very manifold, and appears to have always stood in some connection with neighboring eruptions of igneous rocks. The local re-action of the igneous-fluid interior of the earth created fissures, forced igneous-fluid masses into many of the same, caused gaseous emanations and sublimations in others; and, in addition, during long periods of time, impelled the circulation of heated water, which acted dissolving at one point and depositing the dissolved substances at another, dissolving new ones in their stead. The whole process is thus not confined to any particular geological period or any particular locality; but recurs at all times, either in the same or new regions, at the point where a re-action of the interior of the earth has taken place. So much on the general formation of lodes; in detail, it can only be proved for the particular case."

Gamgee Meat Preserving Process.

Professor Gamgee's process for the preservation of meat is, since the late improvements, pronounced a complete success. As it is in that case a most important example of applied science, we give an outline of it from the London *Times*:

"The chief agent employed is sulphurous acid; but in order to prevent this from flavoring the meat, there is a preliminary exposure to carbonic oxide, by which the coloring matter of the blood and tissues is rendered able to resist the reducing of decomposing action of the acid. In the first place the animals are killed by being made to breathe carbonic oxide,—that is, by a process analogous to the administration of chloroform. Insensibility is quickly produced, and then the animal is bled, and the carcass dressed in the ordinary way. In a temperate climate an artificial process of refrigeration is required. By this the carcass is reduced to about 50° Fah.; it is then placed in an air-tight chamber, into which an atmosphere of mixed carbonic oxide and nitrogen is driven by a blower. In this chamber there is a wooden case, containing charcoal, charged with sulphurous acid; and after the carcasses have been for a certain period exposed to the carbonic oxide and nitrogen alone, the lid of the case is drawn off by a thong passing through a stuffing box, and the charcoal gradually gives off its acid to the meat. The chamber is left undisturbed for seven or eight days in the case of sheep, ten days for pigs, and eighteen or twenty for bullocks. After this the door is opened, and the meat is taken out ready to be stored or packed."

"The Scientific Press" is the name now adopted by the publishers of the Mining and Scientific Press for their journal. It has been for many years, and still is, the leading mining journal of the United States. Every number contains a resume of the entire mining news of California, Nevada, Montana, Idaho, Colorado, and other mining States and Territories. Also, designs of new and useful inventions, with full descriptions. Its editorials are able, dignified, and comprehensive. It is just the paper that our mining friends require Terms, $4, coin, per annum. Address, Dewey & Co., 414 Clay street, San Francisco.—*Virginia City (Montana) Times, Feb.* 16.

Treatment of Rebellious Silver Ores, by Charles H. Aaroo—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24w

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Layres' Elements of Composition.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

Surveyors can have their instruments repaired at C. Muller's, 205 Montgomery street. *

New Mining Notices.

Cordillera Gold and Silver Mining Co.—Notice.—The Annual Meeting of the Cordillera Gold and Silver Mining Company, Chihuahua, Mexico, for the election of officers, will take place on Monday evening, March 21st, at three o'clock P. M., at the office of the Company, 321 Washington street, San Francisco.
mar12-2w HENRY R. REED, Secretary.

Glenwood Mill and Mining Company.—Location of Works: Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the seventh day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of March, 1870. to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, 418 California street, San Francisco. feb52

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until the sixth day of April, 1870, and the sale thereof until Wednesday, the twenty-seventh day or April, 1870. By order of the Board of Trustees.
mar12 O. D. SQUIRE, Secretary.

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of March, 1870, an assessment of two dollars ($2.50) and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 23d day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.
Office, 220 Clay street, San Francisco. mar12

North San Francisco Homestead and Railroad Association:—Location of Property: City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Association, held on the ninth day of February, 1870, an assessment of seven dollars and fifty cents was levied upon the capital stock of said Association, payable immediately, in United States gold coin, to the Secretary, at his office, No. 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the ninth day of March, 1870, shall be declared forfeited, and duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of March, 1870, to pay the delinquent assessment thereon, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.
Office, 415 Montgomery street, San Francisco. feb12

Postponement.—The publication of the delinquent list of the North San Francisco Homestead and Railroad Association is hereby postponed until the twenty-third day of March, 1870, and the sale thereof until the fourteenth day of April, 1870. By order of the Board of Trustees.
mar12 EDWARD C. LOVELL, Secretary.

U. S. Grant Mining Company.—Location of Works: Carlisle, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of January, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

S. gold and silver coin, to the Secretary, at the office of the Company, No. 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. A. JENNINGS, Secretary.
Office, 419 California street, San Francisco, California.

A Valuable Book for Inventors and Artisans.—Dewey & Co., publishers of the Scientific Press and Patent Agents, have just issued a neat little volume of over five hundred well executed cuts of the principal mechanical movements known. These useful representations of the various appliances of power are printed side by side with explanatory notes, which makes the subject clear to every reader. Such a book should be in the hands of every mechanic, and form part of every public school library. It is a handy book, and cheap enough for every farm, shop and factory. Sent to any address from the Scientific Press office, postpaid, for $1.—*New Age.*

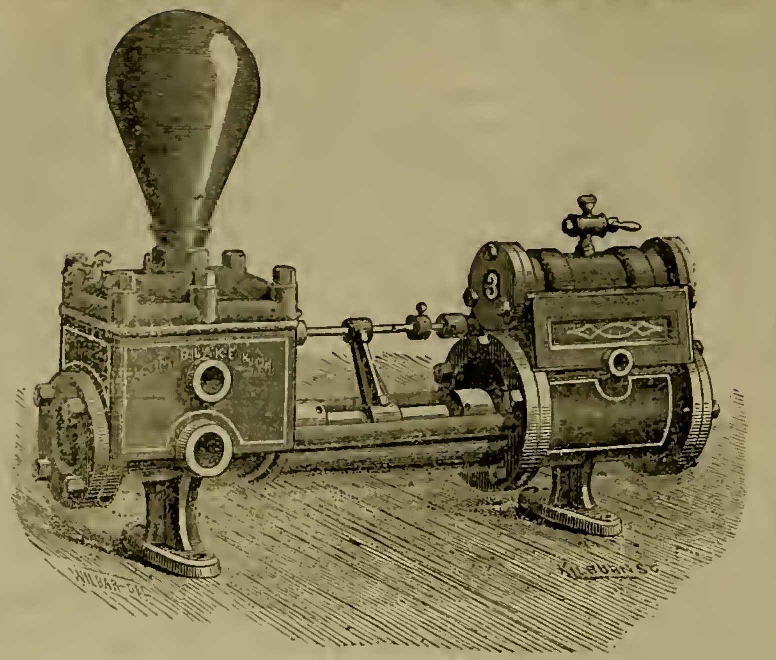
BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is positive under any pressure. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries,

And as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. Twelve different sizes are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞ Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Franoisco; as being the Best Steam Pump on Exhibition.

This was no empty honor, as four of the principal Steam Pumps of the country were on Exhibition as competitors for the prize beside "The Blake," neither of which received any higher recognition than a diploma or certificate of merit.—*See Official Report of Awards.*

USE
DR. S. GIRARD SMITH'S
ARAMIRACULAS
—FOR—
RHEUMATISM, GOUT AND NEURALGIA.

CURES GUARANTEED.

Has cured Thousands. Has never been known to fail. One bottle will relieve you.

OFFICE, No. 621 KEARNY STREET.

Dr. S. Girard Smith, 621 *Kearny street.*—Dear Sir: It would be hard for me to say how much I thank you for the benefit your ARAMIRACULAS has conferred on me in curing my RHEUMATISM. I was confined to my bed when I first commenced to take your medicine, and after using ONE BOTTLE I am now able to work as well as before. If you know anything about having that afflictive complaint, you must know how good it is to be cured. I will state to those who may not believe in your medicine, that they can be convinced by referring them to me. Very respectfully, yours,

ENON HARRIS,
Everard's Auction Rooms, 527 Kearny street.

Statement of an old and well-known Physician who has practiced extensively in Europe and America.

We must admit that the many systems of medicine by which we have attempted to heal the human body, and rid it of disease, from the science of ALLOPATHY down to HYDROPATHY, how little they have succeeded, time has abundantly shown by their number of failures. In the cure of RHEUMATISM, GOUT and NEURALGIA, Dr. S. Girard Smith has laid aside the old way and adopted a system, so simple, that I must admit, is so natural and direct, that it recommends itself to all who are suffering with the above diseases. And it challenges and defies all the old methods of treatment. Although I have been educated through a regular course, and graduated in Europe, I must acknowledge the right, and also give due credit for personal benefit received by the new system as practiced by DR. S. GIRARD SMITH, which induces me to bear this testimony to its merits, for the benefit of suffering humanity.

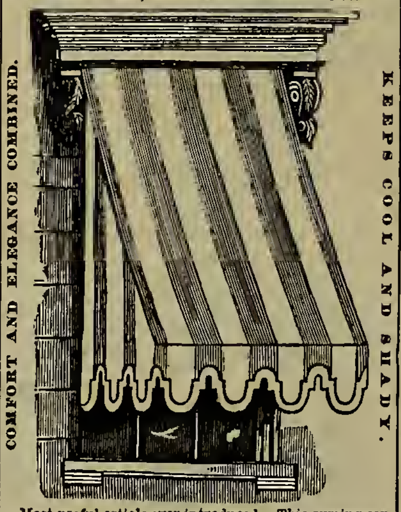
11v20-3m New Orleans.

Newly-Improved Venetian Awning,

FOR STORES, HOTELS AND RESIDENCES.



COMFORT AND ELEGANCE COMBINED.
KEEPS COOL AND SHADY.

Most useful article ever introduced. This awning can be applied to the outside of any window without marring the wood-work or detracting aught from the beauty of the architecture. By the appliance of the new Patent Slide, the awning is made to come low enough to shade the longest window to the bottom, thereby protecting everything in the room from the sun, allowing a free ingress of air through the open window and giving abundance of light. Manufactured from different kinds of goods, colors and stripes, according to price and fancy, by the sole proprietors and manufacturers, J. J. WITHERS & CO., 120 Leidesdorff street, bet. California and Sacramento. T. G. ANDERSON, Agent. 11v20-3m

GIANT CEMENT.
GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, Miners' Rubber Cement, for mending Rubber Boots, Shoes, Belting, Coats, and those without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in tin cans only, with full directions. Take no other. Giant Cement and Miners' Rubber Cement are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT.
MINERS' RUBBER CEMENT.

PARIS
Scouring and Blanket Cleaning
ESTABLISHMENT.

Blankets are cleaned in such a manner as to give them their original elasticity and gloss. Flannels of all kinds are cleansed and scoured *without fulling.* Ladies' Dresses and Wearing Apparel of all kinds are scoured and cleansed after the latest Paris style, for which Mr. Weyer's father was awarded a Medal at the Paris Fair. Silk Dresses are prepared so as to have their original gloss and appearance. Furs neatly cleaned. Curtains are washed and done up in a superior manner. Gent's Clothing of every description scoured and cleaned so as to look as well as new. Samples can be obtained at the Powell street establishment and in the branch offices, showing that my work is done in a superior and skillful manner that will suit the most fastidious. Orders called for and delivered without extra charge.

Parties in the country can have their work done well and promptly by sending their goods with orders by express.

A. WEYER, proprietor, No. 1719 Powell street; branch offices, 122 Fourth street, and 862 Folsom street. ORDER BOXES, 740 Washington street, corner Sutter and Powell, corner Fifth and Howard, corner Powell and Bush. 10v20-3m

---

PATENTS FOR SALE.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

HOTCHKISS' CLOTHES DRYER.

This invention is for house use. It can be fastened to the wall with two screws, and removed without taking them out. When not in use the arms can be folded closely against the wall. Each arm has an iron brace to support it. This is really a "good thing in a family." County or State rights for this will be sold very low. Full particulars given on application.

BURGESS' PATENT PAPER FILE.

This is a recent patent, and one of no ordinary merit. It is light and complete, yet costs but little. In all file-holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much time and trouble. This device is easily adjusted, is not liable to tear the paper, nor let it loose. This patent is also used in combination with covers for forming music folios. Musicians who have seen it, speak in the highest terms of its value. No person can fully appreciate the Paper File or Music Folio without seeing one.

THE RANDALL RAKE.

Here is an article that we take pleasure in recommending. This patent has been for some time on this coast, but for want of means has been allowed to remain comparatively quiet. It will require from seven thousand to ten thousand dollars to handle this invention successfully on the Pacific Coast, and we would advise any one with this amount of capital to look into the merits of this patent before embarking in other business. We cannot see why it will not eventually supersede all other horse rakes. It does its work completely and is easily operated. It is so constructed that the teeth play on an iron rod independently of each other, and therefore accommodate themselves to any surface. The inclination of the teeth to the surface prevents them from raking up sand and dust with the hay, and causes them to glide easily over the ground. The driver has a spring seat to sit upon, and a simple action of the foot is all that is necessary to drop the hay. A complete model can be seen at our office, or references can be had to parties who have them in use on their farms.

OTHER PATENTS.

We have a number of small patents, for which the right of the United States or any State can be bought very reasonable.

WIESTER & CO.,
11v20 314 Bush Street, San Francisco.

FOR SALE.

The Right of a very valuable invention secured by Letters Patent. An article of real merit, that will sell in nearly every family. Here is an opportunity for a young man to do well with a few dollars. Call and examine it.

WIESTER & CO.,
10v20 314 Bush street, San Francisco.

Our Home Physician.

AGENTS WANTED—OUR HOME PHYSICIAN, by Geo. M. Beard, A. M., M. D., of New York. Copyrighted 1869. The only complete Family Medical Book written since 1860. Plain, practical and reliable. Its superior merits are indorsed by leading medical journals and physicians at the East and on the Pacific coast. Send for circular representing its merits. WESTERN PUBLISHING AGENCY, 411 Kearny street, San Francisco.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

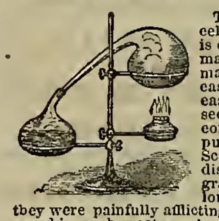
Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.



The reputation this excellent medicine enjoys, is derived from its cures, many of which are truly marvellous. Inveterate cases of Scrofulous disease, where the system seemed saturated with corruption, have been purified and cured by it. Scrofulous affections and disorders, which were aggravated by the scrofulous contamination until they were painfully afflicting, have been radically cured in such great numbers in almost every section of the country, that the public scarcely need to be informed of its virtues or uses.

Scrofulous poison is one of the most destructive enemies of our race. Often, this unseen and unfelt tenant of the organism undermines the constitution, and invites the attack of enfeebling or fatal diseases, without exciting a suspicion of its presence. Again, it seems to breed infection throughout the body, and then, on some favorable occasion, rapidly develop into one or other of its hideous forms, either on the surface or among the vitals. In the latter, tubercles may be suddenly deposited in the lungs or heart, or tumors formed in the liver, or it shows its presence by eruptions on the skin, or foul ulcerations on some part of the body. Hence the occasional use of a bottle of this *Sarsaparilla* is advisable, even when no active symptoms of disease appear. Persons afflicted with the following complaints generally find immediate relief, and, at length, cure, by the use of this *SARSAPARILLA: St. Anthony's Fire, Rose or Erysipelas, Tetter, Salt Rheum, Scald Head, Ringworm, Sore Eyes, Sore Ears*, and other eruptions or visible forms of *Scrofulous* disease. Also in the more concealed forms, as *Dyspepsia, Dropsy, Heart Disease, Fits, Epilepsy, Neuralgia,* and the various *Ulcerous* affections of the muscular and nervous systems.

Syphilis or *Venereal* and *Mercurial Diseases* are cured by it, though a long time is required for subduing these obstinate maladies by any medicine. But long continued use of this medicine will cure the complaint. *Leucorrhœa* or *Whites, Uterine Ulcerations,* and *Female Diseases,* are commonly soon relieved and ultimately cured by its purifying and invigorating effect. Minute Directions for each case are found in our Almanac, supplied gratis. *Rheumatism* and *Gout,* when caused by accumulations of extraneous matters in the blood, yield quickly to it, as also *Liver Complaints, Torpidity, Congestion* or *Inflammation* of the *Liver,* and *Jaundice,* when arising, as they often do, from the rankling poisons in the blood. This *SARSAPARILLA* is a great restorer for the strength and vigor of the system. Those who are *Languid* and *Listless, Despondent, Sleepless,* and troubled with *Nervous Apprehensions* or *Fears,* or any of the affections symptomatic of *Weakness,* will find immediate relief and convincing evidence of its restorative power upon trial.

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President............SAMUEL MERRITT.
Vice-President............MICHAEL REESE,
Treasurer............J. SELIGMAN & CO.
Secretary and General Agent.........W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel,

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast,

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

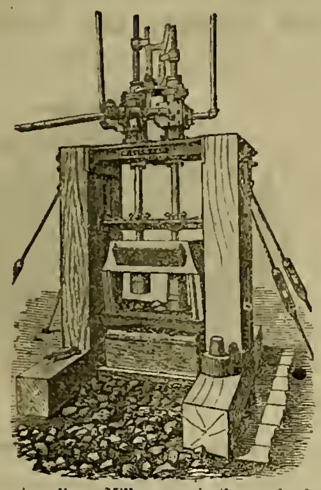
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELE, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,
1v1 San Francisco.

Crandall's Patent Spring Bed.

Manufactory, corner Front and M streets, Sacramento. COOLEY, HENRY & CO., Proprietors. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs—or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds.

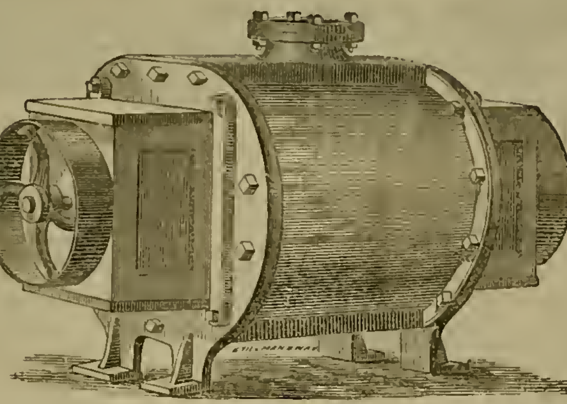
☞ Orders received at our manufactory, or at our agency in San Francisco. 7v20-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

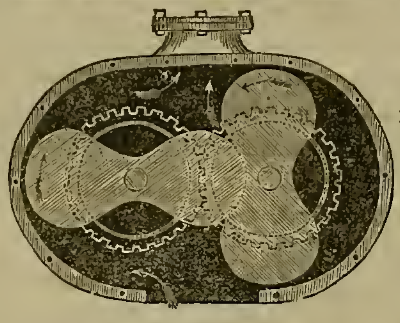
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

"The Manufacturer and Builder."

A PRACTICAL JOURNAL

—OF—

INDUSTRIAL PROGRESS.

PUBLISHED MONTHLY.

NOW IN ITS SECOND YEAR.

Every Manufacturer and Builder should have it. Every Operative and Mechanic should have it. Every Architect and Mason should have it. Every Painter and Plumber should have it. Every Carpenter and Blacksmith should have it. Every Counting-room and Library should have it. Price within the reach of all.

Subscription only $1.50 per year.

32 Large Quarto Pages for 15 cents.
348 Large Quarto Pages for $1.50.
Filled with valuable reading matter.

It costs less than Three Cents per Week!

A single hint in this paper may be worth hundreds of dollars, or prove a fortune to many.

"The Manufacturer and Builder"

Is splendidly illustrated with engravings of everything new relating to manufacturing and building.

Get Your Clubs Together.

PREMIUMS.

We are induced to offer the following Cash Premiums to those who will work to get up those clubs. $5, $10, $15, $20, made in as many minutes! Read! Read! Read!

On every club of 4 names, at $1.50 each, $ 1 cash.
On every club of 10 names, at $1.50 each, $ 3 cash.
On every club of 15 names, at $1.50 each, $ 6 cash.
On every club of 20 names, at $1.00 each, $10 cash.

Including twenty and for every additional name obtained above that number, fifty cents each.

Where from ten to five hundred men congregate daily, there is no difficulty in raising these clubs. If the money be forwarded to us with a list of names, the amount of premium may be deducted from the same.

Push the good work, and make glad the hearts of your fellow-workmen.

CLUBS IN VILLAGES AND TOWNS may be procured by any enterprising man or woman. Send for specimen copy, circulars, instructions, etc., free. Take them and go among your friends and neighbors. In a half day you will often accomplish the task, and five, ten, or fifteen dollars will be earned, together with the satisfaction of knowing that you have benefited your fellowmen. Adress your orders plainly,

The Aerial Steam Navigation Company.

At a meeting of the stockholders of this company, December 17th, 1869, Messrs. Eugene Sullivan, Thomas N. Cazneau, Henry F. Williams and Simon L. Jones were appointed a committee to receive subscriptions for one thousand shares (one-tenth of the capital stock of the company) at the rate of ten dollars per share of the par value of one hundred dollars, said shares to be *unassessable.* The funds thus raised are to be devoted exclusively to the construction of the first aerial steam carriage, and to be deposited in the Bank of British Columbia, to be disbursed upon requisition of Mr. George K. Gluyas, Engineer of Construction. The working, drawings, etc, can be seen at the office of Gen Thomas N. Cazneau, No. 321 California street, where subscriptions will be received. No invention for navigating the air has before received such positive indorsements from engineers of reputation, or so liberal encouragement from prominent capitalists' as Marriott's Avitor, which now seems sure of being thoroughly tested on large scale. 2v20-my

AGENTS WANTED.

One or two active and reliable Agents can obtain permanent and profitable employment by addressing or calling at this office.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods CHEAPLY, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $25 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,
1v20-1m 302 Battery street, San Francisco.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco. 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Farming and Mechanic Arts.

BY DEWEY & CO., Patent Solicitors.

San Francisco, Saturday, March 19, 1870.

VOLUME XX. Number 12.

Bull Run District.

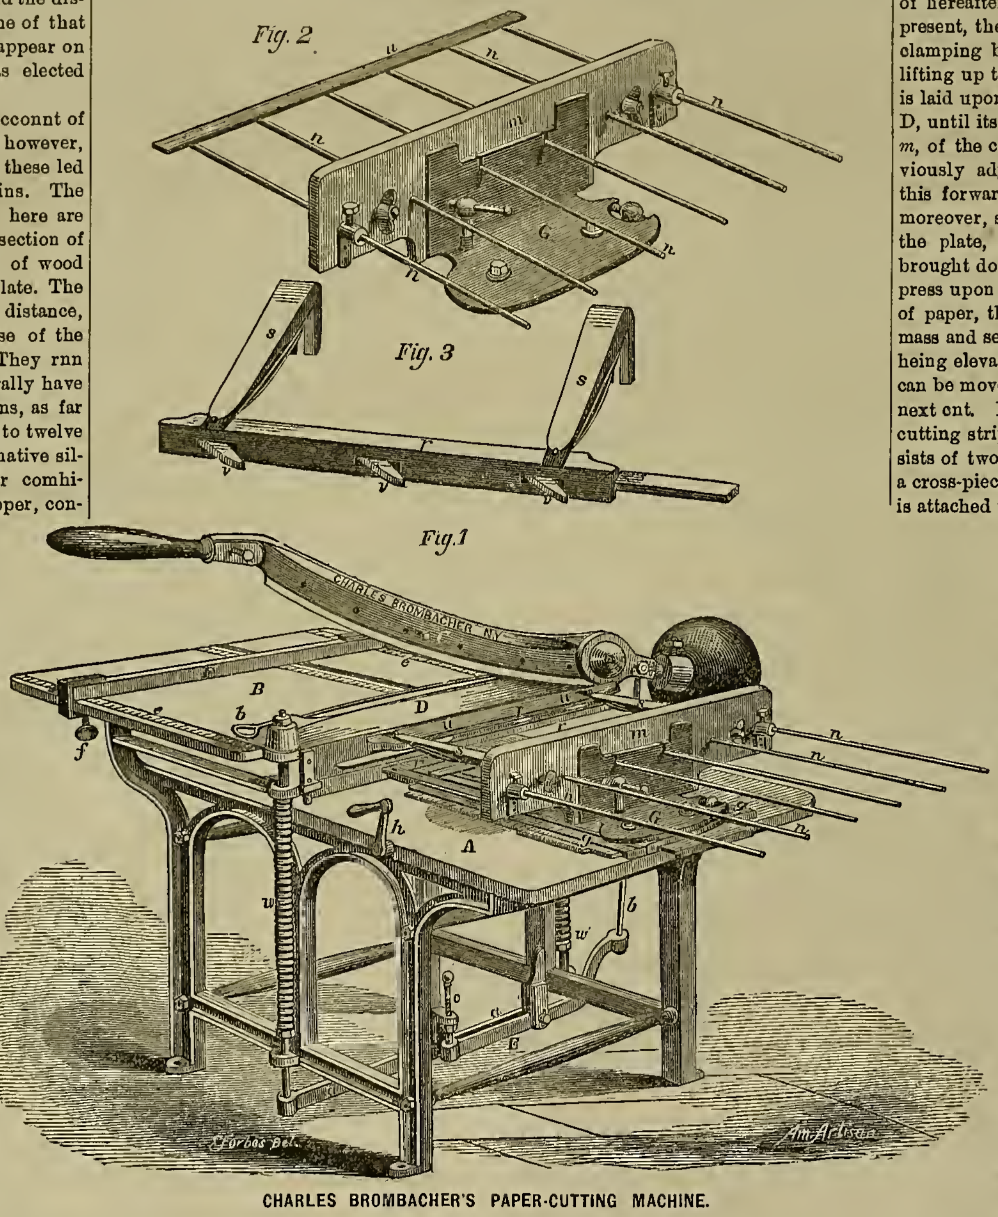
We received a call last week from Mr. J. Johnson, who is engaged in practical operations in the above-named locality, and who gives us some data with regard to the place. This is situated on the line of Idaho and Nevada, about fourteen miles south of Cope, and eighty miles from Elko. The discoveries were made in 1869, and the district organized on the 22d of June of that year. About 150 to 200 names appear on the papers. James Patterson was elected Recorder.

The first excitement was on account of the placer diggings, from which, however, not much has been obtained; but these led to the discovery of the quartz veins. The country is mountainous, in fact here are the highest mountains in that section of the country. There is a plenty of wood and water. The country rock is slate. The ledges have been traced a long distance, from one to two, and, in the case of the Nevada, five miles, it is said. They run about north and south, and generally have a dip towards the east. The veins, as far as opened, vary from six inches to twelve feet in width. The ore contains native silver, horn silver, and several other combinations of that metal, some copper, considerable arsenic, and in places large amounts of galena and pyrites; oxide of iron is also found and some native copper. The principal mines are the Porter, Nevada and Found Treasure. Ex-Governor Chellis is one of the most extensive operators, and proposes putting up a 20-stamp mill in the spring. Considerable of the rock has been worked in various places. Three and a half tons from the Porter, worked in this city, yielded $3,700 to the ton. Mr. J. showed us a certificate of assay of ore from the Ophelia, which yielded $125.48 gold, and $948.81 silver, or a total of $1074.29 to the ton. The only mines worked this winter are the three mentioned above and the Norwich, but a number of others will be opened up in the spring. The greatest depth reached, so far, is twenty feet, and the ledge shows well.

* * *

The State Normal School.—The exercises of the graduating class were held at Platt's Hall on the evening of the 10th inst. Essays were read and songs sung, and the evening passed very pleasantly. Such an institution as this should have the greatest care and attention bestowed on it, as one of the most important in promoting civilization, or, in other words, education. The number of graduates this year is 44. We cannot speak too highly of the exercises, which reflected great credit on teachers and scholars, and wish we had the space to particularize.

Brombacher's Paper-Cutter.



CHARLES BROMBACHER'S PAPER-CUTTING MACHINE.

Among the numerous machines for cutting paper, we give this week an illustration of an ingenious but rather complicated apparatus which is intended for this purpose, although we think that all knives of this kind are, in practice, better adapted for cutting board for the binder than for paper. A suitable frame-work supports a table, A, which, in turn, sustains the gaging mechanism, and also, at its back part, the platform, B, whose principal use is to hold the paper. The front edge of B is so formed as to constitute the fixed shear-edge past which works the cutting-blade, C, which has a counter-weight at its outer end. A clamping-bar, D, is secured to vertical rods, which are connected by a transverse bar, *a*, a lever, E, and the rod, *b*, with the arm of the cutting blade. The vertical rods have spiral springs, *w*, which tend to press D down on the paper; the lever, E, is furnished with a short stem, *c*, which passes through a vertical socket in the bar, *a*. These parts are so arranged that when the cutting-blade is raised up beyond a certain point, the lever, E, will be operated to raise the clamping bar, D. When thus raised, this bar may be retained in an elevated position, irrespective of the movements of C, by means of a simple device operated by a horizontal rod, *b*, shown above D. The platform, B, is provided with scales *e*, and a gage-bar, F, which can be adjusted in any position, and there retained by means of the screws, *f*. On A are two guides, or ways, *g*, upon which is placed an adjustable carriage, G. On the under side of this carriage are racks which gear with pinions on a transverse shaft turned by a handle, *h*, so that the carriage may be moved in or out. The upright plate, *m*, of the carriage is furnished with a series of horizontal rods, *n*, connected at their inner ends by a flat strip, *r* (on Fig. 1, or *u* in Fig. 2). These constitute a gage-frame, which supports the paper to be cut from the mass and gaged by the plate, *m*.

A supplemental device, I, is applied when strips, instead of sheets, are to be cut from the mass of paper, and this will be spoken of hereafter. This being removed for the present, the operation is as follows: The clamping bar, D, having been raised by lifting up the blade, C, the mass of paper is laid upon B, and brought forward, under D, until its forward edge touches the plate, *m*, of the carriage, G, which has been previously adjusted in the proper position, this forward portion of the paper being moreover, sustained by the gage-frame of the plate, *m*. The cutting-blade is then brought downward, thereby causing D to press upon and hold in position the mass of paper, the cutter shearing through the mass and severing the sheets: The cutter being elevated, D is raised and the paper can be moved to the proper position for the next cut. In order to fit the machine for cutting strips, the appliance, I, which consists of two elastic horizontal arms, *s*, and a cross-piece, *r*, (in Fig. 3, or *u* in Fig. 1), is attached to and behind the plate, *m*, of the carriage, G. The portions of paper to be severed from the mass are supported during the cutting operation by short studs, *v*, which project from the cross-piece, as shown in Fig. 3. This cross-piece serves as a stop in the place of the plate, *m*, against which the front edge of the paper may be gaged, and the arms, *s*, being elastic, are capable of yielding beneath the back of the cutting-blade when it descends, so that strips, no matter how narrow, may be cut from the mass without interference from the gaging devices.

This paper-cutting machine, which is patented and manufactured by Charles Brombacher, of New York, has been previously illustrated and described in the *American Artisan*. It is worthy of notice, although, as before remarked, experienced workmen are generally opposed to this style of cutting-blade, and it would seem as if simpler constructions might answer in many cases equally well.

* * *

W. T. Garratt & Co.—On the first of February, W. T Garratt, pioneer brass foundryman, admitted to partnership with him Messrs. W. T. Little and James Hillman. Mr. Little is an old hand in the business with Mr. Garratt, and Mr. Hillman has been master mechanic at Mare Island for some six years. Mr. Garratt has just returned from a trip to the Atlantic States.

Communications.

Mills and Mines of Colorado.—No. VIII.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

At the lower end of Georgetown is a large mill, with a sign about twelve feet long and in great bold letters—"No admittance. By order of the trustees." Of course I did not put myself out of the way to ask admittance. I stopped, however, and looked at it, and not a sound was to be heard. Dead, thought I, as mills generally get to be which put on so much "fuss and feathers." I always think when I see signs like this, that the best things trustees could do would be to get one more keg of nails and board up windows and doors, and save money for stockholders thereby. I don't pretend to say how it is here, but in California and Nevada, where Eastern companies have started in with such excessive exclusiveness, they generally come out at the little end of the horn. It is a good evidence of nonsense, rather than of practical common sense work. Profitable mining has more solid practicability about it than almost any other business, and the moment it steps so far into laboratory workings as to require exclusiveness, why, it's on an unsafe track, to say the least, and, on general principles, the sooner they get out of it the more money is saved.

As I have started out fault-finding, I will keep it up for this letter, for fear I may not be in as good humor for it at another time.

In Colorado they rate ore by the cord, which sounded rather odd; but as they say nothing is odd when you get used to it, so I presume Coloradians don't notice it. A cord of wood and a cord of quartz is the same, excepting that you know what a cord of wood is, but how many tons there are in a cord of quartz you can't tell without weighing, as some will go ten and some five, and all intermediate amounts.

American quartz miners generally calculate ore by the ton. It is so in California, Nevada, Arizona, Idaho, Montana; and why Colorado should keep all the rest of us in the dark as to her riches, by using the indefinite term "cord" (and seven-eighths of the miners don't know what it means when they see it) is a query. I have rebelled against the word whenever I have heard it used, and am in hopes to see it dropped by the press if not by the community. Cord is an English term, at all events, Australian, but none of the worse for that; uniformity is what I look at. As things look about here, to an outsider they are rather slow; the stamps go slowly, they build mills slowly, in fact, its rather slow going generally. There is not that "git up and git" that can be seen in the mining districts of Nevada especially. The stamps, instead of going thump, thump, thump, at the rate of sixty to eighty per minute, go chug, chug, chug, at from fifteen to thirty, and much oftener the latter. I saw one twenty-four-stamp mill which took ten months to build, and another institution that has been two years, either one of which would have been put up in California or Nevada, and "busted" a whole host of stockholders, or made them rich, in half the time.

A few weeks ago there was quite a controversy, through the Central City *Register*, a live paper which gives us "Pacific telegrams," as to leaks in low mortar batteries, and it was decided, I believe, that there never was obtained enough gold from under them to pay for cleaning. The reason probably is, because so little is used. In California low batteries were abandoned, for the reason that there was no such thing as keeping them from leaking more or less; and neither can you, Coloradians, if you use mercury in your batteries in desirable proportions. In all our mining we use too little mercury, and in so doing "hold in at the spiggot and let out at the bung." Use plenty of mercury, and look out for it when using it. Well, I can't think of anything more to grumble at just now, and from this fact you may see that most of their faults are readily overcome, and then it may be simply a difference of opinion between Coloradians and a California-Nevadian.

California Gold Nuggets.

[Written for the Scientific Press.]

EDITORS PRESS:—As we have had hitherto no particular record of the large nuggets of gold which have been discovered from time to time in this State, I present you with the following list of some of the localities, as near as can be ascertained, for the purpose of adding something on this interesting point:

SISKIYOU COUNTY.—In a gulch near the Klamath river, a short distance above *Groot's Ferry*, some years ago, a nine-pound lump of almost pure gold was found; and at various times numerous smaller ones, weighing from a few ounces upward, have been discovered.

SIERRA COUNTY.—At *French Ravine*, at various times, large nuggets have been found: In 1850, a mass of quartz and gold, weighing about 36 pounds, over half of which was gold; in 1851, a mass of quartz and gold, worth about $8,000, besides numerous smaller ones, weighing a few ounces and more; in 1855, one of quartz and gold, valued at $10,000; and in 1860, one worth $1,760.

At *Smith Flat*, a short distance above the last locality: In 1861, a mass of quartz and gold worth about $1,500; in 1864, one weighing about 140 ounces, and with but very little quartz; in 1866, one weighing about ten pounds, most of which was gold.

At *Forest City*. In the Live Yankee claims, from 1854 to 1862, twelve nuggets, some of them very interesting specimens, were found, weighing from 30 to 170 ounces each. The Oregon Co's claim, adjoining the last, furnished, between 1856 and 1862, numerous nuggets weighing from 30 to 100 ounces. In other claims in the vicinity numerous large ones have been found. In the Hope & Co. claims, four miles below the Mountain House, a nugget of almost pure gold, valued at $1,770, was taken out.

In *Minnesota*, at various times, numerous large boulders have been found, some yielding over $5,000. In 1869, a nugget of almost pure gold, worth about $2,000, was found at the Little Grizzly Diggings. The same year the Monumental Q. M. Co., at *Sierra Buttes*, took out a piece of quartz and gold worth some $30,000, according to reports.

NEVADA COUNTY.—At *Remington Hill:* In 1855, a nugget of quartz and gold, worth $3,500; in 1867, one worth about $2,400; and at numerous times various pieces, weighing a few ounces and more, have been taken from the same hill.

At *Lowell Hill*, in 1865. a mass of quartz and gold, worth about $1,100, was found, besides numerous smaller ones at different dates.

EL DORADO COUNTY.—In the vicinity of *Pilot Hill*, various boulders of quartz and gold have yielded large amounts; one, in 1867, yielded about $8,000. At the Spanish Dry Diggings, a few years ago, a beautiful mass of dendritic crystallized gold was found, which weighed about 16 pounds, besides numerous smaller pieces.

PLACER COUNTY.—In 1864, on the middle fork of the American river, two miles from *Michigan Bluffs*, a fine large mass of almost pure gold was found, which weighed 15¼ pounds.

CALAVERAS COUNTY.—In the quartz claims at *Carson Hill* numerous masses of gold weighing from six to seven pounds have been found. In November, 1854, a nugget of quartz and gold was discovered in this county which weighed 195 pounds troy, valued at $37,400. This is the largest piece ever found in the State.

There is no doubt but that many other large masses of gold have been found in the State, and it is to be regretted that we have no full list. I give the above as a start in this matter. C. D. V.

* * *

TOBACCO.—Professor Sée, of Paris, in a recent lecture on tobacco, pointed out that the proportion of nicotine varies according to the kind of tobacco. Thus, that produced in Germany and Alsace contains from seven to three per cent. of nicotine, while that from Havana and Maryland has only two per cent. In small doses, nicotine aids respiration, and does not affect the heart; but in larger quantities the Professor showed that it produces convulsions of the respiratory muscles, an accelerating and intermitting pulse, and a tremulous condition of the muscles.

A NEW French invention is a portable fresh butter churn, to be used at each meal. It is made of crystal and mounted on silver feet. A silver rod revolves quickly in the cream, and presents a pat of butter every three minutes.

The Climate of California.

At a meeting of the Academy of Sciences in this city, last week, a very interesting paper was read by the President, Dr. Blake, on the climate of this State, more particularly in relation to our extreme seasons of drought and rain. After alluding to the laws which govern the general movement of the atmosphere—laws as inevitable and determinate in their action as the ordinary changes in the weather are apparently capricious—it was remarked that the

Polar and Equatorial Currents

which in the regions of the trade winds are superimposed, the one on the other, in the more northern or southern latitudes run in parallel streams over the surface of the earth, the southern or equatorial current, with the warmth and moisture, most frequently reaching the polar region over the surface of the larger oceans, whilst the polar currents predominate in the interior of the continents. These currents are evidently subject to great lateral displacements, and it is to the mixing of cold and dry polar currents with the moist and warm equatorial current that most of the storms and rain in the temperate zone are to be attributed, and not, as is usually supposed, almost exclusively to the vertical descent of these air currents. These vast air currents often occupy a large portion of the earth's surface for considerable periods of time, without apparently any lateral disturbance, causing extreme seasons of drouth or rain, as the regions over which they prevail are situated under a polar or equatorial current. In applying these laws to the climate of this State, it was stated that in our ordinary winters,

Our Geographical Position

is such that we are situated about in the parallel where the two currents mix, so that the frequent lateral displacements to which they are usually subject give us a sufficient rain-fall; but in extreme seasons of drouth we are more completely under a polar current, and in seasons of great rainfall we are more in the equatorial current, or, more probably, about at the point where the two currents meet, and where the greatest atmospheric disturbances take place. The influence of our mountain chains in deflecting the S. W. equatorial current is shown by our storms when we are fully under the influence of this current, being almost always accompanied by a S. E. wind, whilst in Europe the S. W. winds give the most rain. The same barrier to the eastward, by opposing an obstacle to the sudden lateral eruption of masses of warmer or cooler air into the colder or warmer currents, prevents the occurrence of thunderstorms and cyclones in our State, and also accounts, probably, for the barometer not falling so low in our southern storms as is usually the case in other portions of the temperate zone when equatorial storms prevail, the air being heaped up by striking against the Sierras. Illustrating the above observations by the more marked features of our climate during the present winter, it will be seen that

Our Early Rain

In October was caused by our coming for a short time under the influence of the southern current which had been prevailing in Oregon during the latter part of September and in October, causing very heavy rains. On this occasion the northern current was not displaced far enough for the equatorial current to reach the southern part of the State, although all the northern part of the State, and as far as some fifty or sixty miles south of San Francisco, came under its influence. From October until February the northern current prevailed over the whole State, with occasional irruptions of moist air from the edge of the south current which was prevailing at a hundred or two miles to the westward of the coast, as during the month of December, particularly, almost every ship that arrived reported heavy weather, with strong S. W. winds, at a short distance from the coast. About the 7th of February indications of the coming southerly current were observed, and on the 9th it reached the surface here about noon, although it was felt at Virginia City some hours earlier, as a S. W. storm of great intensity, the greater elevation of this point (about 8,000 feet) accounting for its being first reached.

The Details of the Last Storm,

As it reached different points of the State, were shown to be connected with the lateral displacement of the air currents, and from a comparison of the weather here with that prevailing during the winter in the Western and in the Eastern States, it was shown that the breadth of the Polar current, near the western edge of which we were situated, had its eastern border in the western part of the Mississippi Valley, whilst to the east of this an equatorial current has prevailed during the greater part of the winter, ensuring a warm, moist season, over most of the Middle and Atlantic States, whilst that part where the borders of two currents came into opposition has been marked by severe tornadoes and storms in the Mississippi Valley, on the eastern edge of the Polar current, and also on the western edge, at a short distance from our coast. At the time of the great displacement of the Polar current on this side of the continent, it would seem that the southerly current that had been prevailing in the Eastern States was displaced in the same direction as the eastern border of the Polar current reached the Atlantic coast, even in the Southern States, on the 21st—the time of the greatest lateral displacement on this coast; and it is

An Interesting Fact

That at the time these movements were taking place in the currents prevailing here, violent atmospheric disturbances were being felt on the Atlantic side and in Europe. There undoubtedly must be some law which governs these great atmospheric movements—some cause which makes a polar or equatorial current flow in some seasons for months apparently undisturbed between certain parallels of longitude, whilst in other years they occupy very different positions—which in some seasons causes these vast air currents to flow in a broad and apparently stationary bed, and in other seasons to be subject to frequent displacements. If ever meteorology shall afford a scientific basis for predicting the character of our seasons, it must be by a more careful investigation of atmospheric phenomena, in relation more particularly to the laws which govern the movements and positions of these large atmospheric currents.

Unfortunately, up to the present time but little attention has been paid to the subject under this point of view; but the extension of telegraphic communication over so large a portion of the northern hemisphere affords facilities for studying the subject, which it is hoped will not be long neglected. This continent, from the direction of our mountain chains, being more or less parallel to the direction of the air currents, offers a much better field for their investigation than the old world, in which the principal mountain chains are at right angles to the currents, causing much greater and more irregular atmospheric disturbances.

The memoir, of which the above is but an abstract, corrected for us by Dr. Blake from the reports in the dailies, will be published in the transactions of the Academy.

* * *

SWINDLES PRACTICED ON INVENTORS.—The *American Artizan* says: We have constantly brought to our notice the dishonest means of obtaining money from inventors and patentees practiced by a certain class of patent attorneys. Some of the dodges resorted to are so ingenious that we do not wonder so much at their success. Others are clumsy, and only succeed through the barefaced effrontery with which they are carried out. Among the latter, is the latest one we have heard of, in which an attorney, after having prepared a caveat and received the Government fee and a fee for his services in preparing it, persuaded the inventor to pay him fifty dollars additional to take it to Washington and see it properly filed.

Such cases, and worse, occur in California as well as in New York.

* * *

THE Russian newspapers announce that experiments will shortly be made on the Neva, with a new invention for propelling ships without using either paddles or screws. The author of this invention is M. Liwczak, an Austrian by birth, who, some time ago, invented a flying machine propelled by steam, and subsequently became the editor of a Panslavist paper published in Vienna.—*Van Nostrand's Eclectic Magazine.*

* * *

THE Western Pacific Railroad Co. are going to build, at Oakland Point, a large and commodious boarding and lodging house, for the accommodation of their workmen. This action has been brought about by the high prices charged for board and lodging in Oakland, which are twenty-five per cent. higher than in San Francisco.

* * *

THE manufacture of alcohol from reindeer moss, which was set on foot in 1867 by Prof. Sternberg, of Stockholm, is now carried on to a considerable extent in Sweden and Norway.

Mechanical Progress.

Progress in Boiler Engineering.—We quote and condense the following from the Chief Engineer's last monthly report of the Manchester Steam-Users' Association: "On the whole, the standard of boilers is improving. A greater number of furnace tubes are constructed with encircling hoops, flanged seams, or other suitable appliances for preventing collapse, and with the longitudinal joints welded instead of riveted, while the shells are more generally double-riveted at the longitudinal seams, and less frequently weakened at the base of the steam dome by a large opening. In many boilers steam domes are now discarded altogether, internal anti-priming pipes being substituted. Added to this, the boiler ends, instead of being in two or more plates riveted together, are made in one piece, those for the fronts being turned up at the outer edges, and bored out to receive the furnace tubes, the special advantage of which is that it insures a true circular shape. Also it is becoming more general to equip every boiler with a separate steam pressure gauge, as well as with a duplicate glass water gauge, and duplicate safety valve. Feed valve boxes are more generally attached to the boiler fronts, being placed where they are more accessible. In setting boilers, midfeathers, so conducive to external corrosion, are rapidly giving way to side walls. The watchword of all boiler construction, equipment, and setting, should always be, and is becoming, everything above board, open to view, and easy of examination."

The Secret of the Nickel-Plating.—At a late meeting of the French Academy, M. Dumas, the Secretary, made some remarks in reference to the invention of Dr. Isaac Adams, of Boston, noticed some time since in the Press, which made nickel-plating for the first time a practical success. He spoke of it as a "victory" which was likely to "throw light upon many of the phenomena displayed by electro-deposits." We quote:

"The discovery of Mr. Adams consists, above all, in having observed that when a solution of nickel contains the slightest traces of potash, magnesia, etc., the metal, instead of being deposited pure, will be found mixed with little particles of peroxide of nickel, which take from the adherent plating all its cohesion and its beauty. Further, the American chemist employs nickel salts entirely free from a fixed alkaline substance, such as the double sulphate of nickel and ammonia, or the double chlorate of nickel and ammonia. From this moment the operation is made with the greatest ease. The salt is decomposed in the bath, the nickel is deposited on the object placed at the negative pole, and the solution keeps neutral."

An Electro-Heating Apparatus.—*The Journal of the Telegraph* describes an arrangement for warming railway cars, the plan of which is based upon the fact that electricity, in passing through a conductor of insufficient capacity (such, for instance, as a wire of very small diameter), evolves or develops heat. The invention consists in providing an electrical conducting coil, or chain, with intervals of small conducting power, in traversing which the electricity will be caused to evolve heat; and further, in interposing between said obstructing intervals, free conductors of much larger size, which constitute reservoirs of electricity and radiators of heat. In the application of the invention for railway carriages or cars, it is proposed to employ magneto-electric machines, constructed especially for this purpose, for producing the requisite current, placed, if necessary, under the car, and to obtain the power to operate them from axle of the car.

A New Lock-nut.—Another device for the nuts on fish-plate bolts, described by the *Artisan*, consists in having a washer which turns with the nut, and when in place, has its edge indented by the blow of a hammer into a groove in the fish-plate. It is made of soft iron, in order that this may be easily done. It is made to turn with the nut by means of a depression, into which fits a corresponding projection on the nut, or by two leaves, left when it is punched, between which the nut is placed. When the nut is to be removed, it is first tightened a little. This drags the bend straight again, and it thus offers no hindrance to the unscrewing of the nut.

Another Anti-Incrustator.

Engineering describes a device for preventing the incrustation of boilers, designed by Herr Popper. The arrangement, as applied to a plain cylindrical boiler, consists of long strips of sheet iron, twelve inches in width, which are introduced through a man-hole into the boiler and there united, so as to form a half cylinder parallel to the lower half of the boiler. This is supported at a certain distance from the shell by projections on its exterior. Sigl's boiler, to which the apparatus was applied, is four feet six inches in diameter, and the space was an inch and a quarter at the sides, and two and a half at the bottom, the upper edges of the half cylinder being on the level of the low-water line. Herr Popper attaches to the half cylinder a series of central pipes, through which a downward current can flow to the bottom of the boiler. These pipes are five inches in diameter, and twenty-four inches apart. Around them, and filling the half cylinder for a depth of eight or nine inches, are placed pebbles. It is found that all the matters which would form incrustation are deposited upon and between these pebbles, and that the internal surface of the boiler remains perfectly clean.

Steam Engine Economy.—"It is easy to show that it is true economy to sell an old engine for scrap iron and purchase an improved one at full rates rather than pay for the extra coal. For instance, there are few engines working of the old style, regulating by the throttle valve, that furnish an indicated horse power for four and one-half pounds of coal per hour. This is equivalent to say five pounds per hour for each net or effective horse power. An engine developing eighty net horse power would then require 4,000 pounds of coal per day, or say 4,200 including banked fires at night. This for a year, or 300 working days, would equal 630 tons, which would cost, in many localities, upwards of four thousand dollars. Now, a new engine, with cut-off adjusted automatically by the governor, of a size capable of furnishing economically eighty net horse power, costs from $4,000 to $4,500. So it is safe to say that engines constructed with no regard for economy, require yearly, for fuel alone, an expenditure of money equal to the first cost of a new engine."—*Scientific American.*

New Steam Gauge.—At the meeting of the Polytechnic Club of the American Institute, Feb. 26th, a mercurial steam gauge, called the "American Eagle Steam Gauge," was presented. Its essential parts are a steel diaphragm, plated with nickel to prevent corrosion, and, resting upon it, a column of mercury, which is put in a chamber formed by an upper cover and a steel bottom. As the pressure acts upon this steel bottom or floor, the mercury is forced up in the tube, and the scale on the guard indicates the amount of pressure. The diaphragm being some three inches in diameter, gives the mercury in the glass tube above considerable motion. An adjusting screw at the base of the tube gives at once the means of always bringing the column to the zero point, and correcting any variation. The gauge shows remarkable accuracy, following the readings of a syphon gauge without variation through the whole length of its graduation.

A New Dyeing Material.—*Engineering* for Feb. 18th says that a discovery has just been made which promises to prove as important as the discovery of the aniline colors. It is that certain West Indian plants, which have been imported of late years for their fibrous material, have been found to yield a liquid which is a powerful dye, equally brilliant and beautiful with the aniline colors, and at the same time far more permanent, as has been proved by severe chemical tests. The colors, moreover, fix themselves without any mordant. The names of the plants are not given The process of manufacture has been patented, and the article will soon be introduced to the public.

The 600-Pounder Gun.—The 12-inch rifled muzzle-loader of 25 tons, now under test at Shoeburyness, Eng., is to be fired 500 times with a charge of 67 pounds of rifle large-grain powder and Palliser shot and shell of 600 pounds weight. The mean range of the gun at 10° elevation is 4,000 yards.

Scientific Progress.

Calorific Effects of Gases.

At the Salem meeting of the American Association in August, a paper upon this subject, prepared by Profs. Silliman and Wurtz, was read. We have space only for the conclusions arrived at. They are as follows:

1. That of all known gases, the highest calorific effects, under ordinary atmospheric conditions, are obtainable from *carbonic oxide;* whose calorific value, above 100° C., is about 3,000° C.
2. That in absolute calorific value, below 100° C., in the atmospheric medium, *hydrogen* surpasses its volume of any other gas; giving a temperature of about 3,200° C.
3. That for all modes of application—that is, for producing both high and low temperatures—the total maximum calorific effectiveness of carbonic oxide is a *constant quantity*.
4. Compound condensed submultiple volumes of hydrogen, like that in marsh gas, have much *less* calorific value in air than their volume of free hydrogen.
5. Condensed compound submultiple volumes of gaseous carbon, like that in olefiant gas, have no greater total calorific value, in air, below 100° C., than their own volume of carbon gas in the form of carbonic oxide; while above 100° C. their value is even considerably less.

What is Bathybius?—In remarking upon the sarcode which was brought up in abundance in the course of Atlantic soundings some years since, and to which Prof. Huxley gave the name of *Bathybius* (literally, "living in the deep"), Prof. Williamson, F. R. S., says in a late number of the *Popular Science Review:* "There can be no question that Bathybius is the lowest of those known protozoa, which, like the foraminifera, secrete calcareous elements. Remembering the extent to which the sacrode is diffused through the mud of the Atlantic, there appears much that is suggestive and important in the observation of Dr. Carpenter, that, had its power of secreting a calcareous framework been somewhat increased, so that instead of detached structures in the form of coccoliths, etc., it had produced a continuous calcareous mass, it would have given us a living prototype of the Laurentian eozoön. The discovery sustains Dr. Carpenter in his convictions of the animal origin of that primæval structure."

Spontaneous Motion of Protoplasm.—Prof. Schnetzler, who has made observations on the motion of protoplasm in the cells of the leaves of the water weed *anacharis alsinastrum*, believes,—says *Nature*,—the principal cause of that motion to be the action of oxygen, which passes through the walls of the cell, and of which a portion is probably transformed into ozone under the influence of light, as occurs also in globules of blood. The most strongly refracted rays of light have a marked influence on these currents, which are also no doubt affected by currents of electricity between the surface of the leaf and the contents of the cells. The energy of the motion depends principally on the temperature, showing the greatest vigor between 16° and 20° C. The anacharis is especially favorable for the observation of these motions; as, in consequence of the transparency of its tissue, they can be watched under the microscope without any preparation.

Geology of Alaska.—The *American Naturalist* remarks as follows upon Mr. Dall's explorations: "The most interesting results are the determination of the facts that west of the 105th degree of longitude the Alaskan coast is rising, that the former violence of volcanic forces is diminishing throughout the territory, and that there are no evidences of general glacial action. Mr. Dall has traveled thirteen hundred miles up the valley of the Yukon, and explored on the shores of Norton Sound, without obtaining any evidences of glacial action. The whole territory north of the Alaskan Mountains could not, therefore, have been covered by the same general sheet of ice which has scratched the section east of the Rocky Mountains. This raises an unexpected obstacle in the path both of the hypothesis of a general terrestrial glacial sheet, and the theory of floating ice."

The Anti-Development Theory.—T. P. Barkas, F. G. S., recently delivered a lecture to the members of the Newcastle Philosophical Society, upon the coal measure fishes and reptiles, in which he made use of the following language:

"Where is the connecting link, material or psychological, that indicates absolute progress from the lower to the higher, other than that of direct creative interposition? What amœba has become a chambered foraminifera? Where are the indications of articulate forms becoming molluscs? What proof have we that fishes have a tendency to reptilian specialities? Where in the whole wide range of creation is there a single indication that a lower creature has in the long course of ages been the progenitor of a higher? Notwithstanding protoplasmic and other theories, we appear to be no nearer the solution of the deep mysteries of life than were the philosophers of the world's grey dawn; and unless we obtain help from Sweden's greatest seer, and suppose that the material is an outbirth of pre-existing spiritual, we cannot improve upon referring all our problems of life, its succession and mysteries, to the direct fiat of the Almighty artificer."

Improvements in Electric Light Apparatus.—Prof. Jenkin, of Edinburg, has patented an arrangement for lighting up a buoy by a battery on shore connected with it by a submarine cable. The light is produced by a rapid succession of sparks, due to successive charges and discharges of a condenser charged directly from a voltaic battery, without the intervention of any induction coil. The condenser is charged and discharged by a tongue or contact-maker moving backwards and forwards between the battery terminal and an earth terminal. The motion of the tongue may be produced by clockwork wound up by the motion of the buoy, or by currents sent from shore through a second wire.

Action of Magnetism upon Gases.—M. Treve found that when the spark from an induction coil passes through a Geissler tube filled with hydrogen the gas becomes luminous, having a blue tint, plainly violet at the extremities of the tube, and of a fine red color in a capillary prolongation of it. But upon placing the latter part of the apparatus between the poles of a magnet the red instantly disappeared, giving place to a perfectly white light. In like manner oxygen, which gives a milky white light in the capillary tube, became red; nitrogen deepened its blue to a still deeper blue; the brilliant white of carbonic acid became deep blue; the blue of silicium fluoride became a bluish violet. The spectra of these luminous tubes changed when the capillary portions were subjected to the action of magnetism.

Cause of the Ignition of Meteorites. *Les Mondes* says that in a recent communication to the French Academy, Regnault stated that when any gas, as air for example, is traversed by any movement sufficiently rapid like that of sound, or by a body moving with a velocity comparable to that of sound, it may be considered as having lost its elasticity; it is compressed, but does not expand again; and hence the heat produced by the compression not being neutralized by the cold coming from subsequent expansion, may go on accumulating indefinitely. In the case of a meteorite, this increase soon brings it to a point of ignition, then to that of fusion. This theory appears to be more satisfactory than that which attributes the heat to friction of the moving body against the air.

Light of Phosphorescence.—Becquerel, who has been investigating that class of cases in which light is given out without appreciable heat, urges the study of the phosphorescent effects produced by the different refrangible rays which emanate from luminous sources, both artificial and natural. "These effects, like the chemical actions produced by radiation, need to be of but feeble intensity, far less than in the case of calorific rays, to be susceptible of observation. For instance, rays from sources scarce appreciable by our thermoscopic means, as those from the moon and the stars, afford very manifest phosphorescent effects; and, moreover, produce quite energetic chemical reactions."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Exchequer.—*Chronicle*, March 5th: This company continues to take rich ore out of Buckeye 2. Chalmers has several tons of average ore ready for shipment to Reno, for testing by the Stetefeldt process.

AMADOR COUNTY.

The *Ledger* of 12th says: Last week, a little son of Frank McBride picked up a specimen of nearly pure gold, near the Vaughn mine at Pine Grove, weighing two and a half ounces. The same week, Joseph Genazzi found one on Else's creek which weighed $36.

BUTTE COUNTY.

The Indian Valley correspondent of the Oroville *Record* writes Feb. 28th: The storm has been a great blessing to miners and ranchmen. The Round Valley dam was nearly empty, but the supposition is now they will have a fair supply for the reason. The Judkins & Kellogg mill is running on good rock. T. F. Emmons has bought the New York mill. The Crescent is again in full blast. The mill was idle nearly two weeks, on account of a strike by the workmen (Cornish) for the eight-hour system. Mr. Bearsford went below and obtained a new lot of hands. The Light mill and ledge is now owned by Blood & Co., and they are making preparations to commence work. Genesee, or Copper Town proper, has gone down. Only three men are stopping there. Placer mining will take a fresh start in the spring. At Greenville, prospecting is going on extensively, and some are making six to eight dollars per day.

CALAVERAS COUNTY.

Railroad Flat.—*Chronicle*, March 10th: Our neighbors at West Point and Sandy Gulch exhibit considerable activity. Moss & Doyle, at Skull Flat, own the champion mine in that section. They have over 100 tons of rock on the dump that will average $100 per ton. Fifteen tons of inferior ore crushed last fall paid $74 per ton. Gawne & Co., at the same place, who own the old "Zacetara," have resumed work.

EL DORADO COUNTY.

Placerville *Democrat*, 12th: About two weeks ago our townsman, L. C. Fiske, commenced prospecting on Quartz hill, a short distance from town. He had worked for several days with little encouragement, when observing a piece of decomposed quartz which he had thrown out of the hole, he broke it and found a specimen of gold. He has since realized from such detached pieces, from 25 to 40 ounces.

MONO COUNTY.

Dunderberg.—The Carson *Appeal* learns from Dr. Munckton, one of the owners, that two men by the names of Ayres and Isaacs, who had taken a contract to drift one hundred and fifty feet along the Dunderberg lode, struck exceedingly rich ore in large quantities.

NEVADA COUNTY.

Eureka.—Grass Valley *Union*, March 10th: The same old $2,000-a-day rock is running through the batteries.

Last year a Grass Valley gentleman paid a tax on an income of $1,000. His friends thought that he gave in his income at a large figure. He was in the quartz mining business, and he stuck to it. This year he returns an income of $35,000.

Mining Items.—Same of 12th: The mines are all steadily at work, and prospecting is active. The Coe mine is one of the revived ones. A new incline shaft is down 90 feet, and in a few days it will connect with the old incline, which will put the miners down 149 feet. In a few days rock for milling purposes will begin to come out. Webster & Co., on Randolph Hill, are drifting, and are finding very rich gravel. This gravel is of the compact kind, which is always full of gold. The Mammoth Co., just east of Webster & Co., are pushing their works steadily to find the lead. So far the Mammoth Co. have the boulders, cement and such other things as are just above an old river bed. The Empire Co., on Ophir Hill, are raising about 50 tons of rock per day, and the mill is crushing 40 tons. The rock is looking better than it has for some time past, and the supply is more abundant.

Eureka.—13th: Yesterday was the regular day for a clean-up of the mill. We have frequently announced that the Eureka gives about $2,000 per day of gold. Yesterday's proceeds showed better—the last twelve days giving between $26,000 and $27,000 as a yield without the sulphurets or the cleanings from the batteries.

Ditch Enterprise.—*National*, March 9th: Spooner & Co., owners of the American mining claim at Sehastopol, have located the waters of the Middle Yuha river, not heretofore appropriated, at Mississippi Bar, Eureka township, for the purpose of conveying said waters in a ditch to San Juan, Sweetland, Sehastopol, Birchville, French Corral, and other parts of Nevada county, for mining, manufacturing and other purposes.

Mutual.—Same of 10th: We understand the Mutual Co., four miles from Graniteville, are driving their incline shaft night and day. They have it down 250 feet on the ledge, which looks well, but is quite small—varying in thickness from 6 to 20 inches.

Alison Ranch.—From a clean-up last Saturday, from 60 tons of ore taken from the old shaft, we understand about $50 per ton was realized. The shaft is now down 100 feet.

Inkerman.—A perpendicular shaft has been sunk 75 feet, and the company are taking out some very good ore. They are now delivering 30 tons at the Gold Hill mill, which will be crushed in a few days.

Saulsbury Mine.—*Transcript*, March 10th: Saulsbury is taking out a large lot of specimen rock, and some of it looks as though there was more gold than quartz. He is satisfied that it is not a pocket, for a great deal of the fine gold can be seen all through the ledge in the tunnel. He will commence in a day or two to pound up in a mortar, the barrel or two of specimens he has been taking out. It is undoubtedly the very richest ledge ever found in this township.

Mulberry.—Same of 12th: The Mulberry ledge is a recent location of 1,200 feet, on Gold Flat. The discoverers sunk eight feet, in Burnell's lot, and the ten-inch stringer upon which they started was enlarged by another about the same size, making at that depth a well defined 20-inch ledge. The rock looks well.

The same of 13th suggests that a prospecting company be formed in that vicinity, with say 500 shares, and a paid-up capital of 10 per cent.; the money to be expended in the opening of mines where the investment appears good to a board of five trustees.

PLACER COUNTY.

The Ophir Good Friday.—Auburn *Herald*, 12th inst.: Six tons of rock from this mine, Jacob Cowan lessee, was cleaned up one week ago, yielding $2,080 pure gold, an average of $347 to the ton. The quartz was crushed at the old Schnable steam-mill. We are told this quartz scarcely showed gold to the naked eye.

St. Patrick.—We learn that the purchaser, C. F. Eaton, is taking out very rich rock, but no crushing has been had since McLaughlin cleaned up the refuse rock on hand when he sold the mine, and which yielded $300 to the ton. New hoisting works are to be erected.

Placer Canal.—A. J. Angel commenced the construction of this ditch five years ago. It is now completed, and will supply 1,000 inches of water the year round. It furnishes water for the working of numerous high bars and bank diggings, heretofore untouched, except for prospecting. It is estimated that this will furnish work for two hundred and fifty miners. The section where this ditch runs lies a little south and east of Michigan Bluffs.

Rattlesnake Bar.—*Stars and Stripes*, 10th: The late rain has given life to things. Our miners are going to work in earnest. There are several new claims to be worked on old ground, and there are many others that would pay well if worked with cheap labor and water—with large heads of 300 or 400 inches. Heretofore they used small heads, 75 or 100 inches, labor and water were high, and they made small wages. Now, with such apparatus as the globe nozzle, on the Crary & Boles claim, they would certainly pay.

Empire Quartz Mill.—The rock crushed is taken from the company's ledge at Doty's Flat, two miles distant. Stephen Quinn and John McFadden are the owners of the mill and mine. The mill is a water-power ten-stamper. While at the office, we were shown a large amount of bullion, the result of a few day's crushing.

The Shipley ledge is owned by Charley McFadden. The specimen rock from this mine shows a large quantity of free gold, with a more than average quantity of rich looking sulphurets.

American River.—Grass Valley *Union*, March 10th: A company has been organized in this county to work the Mammoth Bar, on the middle fork of the American. The company have plenty of capital and will commence work as soon as the water in the river will permit. This bar is just above Murderer's Bar bridge, six miles east of Auburn.

SAN BERNARDINO COUNTY.

A Los Angeles telegram of March 10th, says: Dr. Wozencraft brings specimens of ore from another tin ledge discovered by his son at Cajon Pass. Gold and silver-bearing specimens were brought from the same locality.

SAN DIEGO COUUTY.

Los Angeles telegram, 14th: From this county, San Bernardino, and every part of San Diego, the rush is to the new diggings. San Juan Capistrano is nearly deserted. From near Anaheim a large party has gone. Quartz has been brought into Anaheim, some pieces of which are fully one-half pure gold. The great extent of the district, it is thought, will start an unprecedented rush from all parts of the State.

A Los Angeles telegram of 24th says:—About forty men in small parties left for the mines to-day; more will leave to-morrow. The increased stampede seems to originate from favorable information received this afternoon from friends upon the ground. It is reported that the best lode yet found was discovered by some Chinamen; this has been jumped and the Chinamen driven off and three Celestials killed. It is said the quartz taken from this mine rivals the specimen rock from the Washington, and the ledge is wider and better defined.

SIERRA COUNTY.

Soale's Diggings.—Correspondent of the *Messenger*, 12th, says: Since my last, the flood-gates have been opened, and the miners are rejoicing in an abundance of water. The Enterprise Co. commenced washing this week.

Some of the old mine owners at Monte Cristo are selling out at $1,350 per share.

The Brush Creek quartz mill is running steadily day and night, and the mine is one of the best in Sierra. The Oriental mine, near Alleghany, is paying well, and other claims are prospecting better than heretofore. Judge Sherwood, of the Blue lead, told us that times were brightening.

TRINITY COUNTY.

Dutton Creek Mines.—*Journal*, March 5th: The general opinion is that it is the biggest strike made in this county for years. A large number of claims have been located, and the owners are starting in to work in earnest. The prospects obtained with pan and rocker range from 3 to 35 cents to the bucket. The only sluicing of which we have been informed, paid at the rate of $12 to the pan, and the gold was brought to town to show for it. The work was done in the first claims located, with a scanty head of water. Only four small boxes were used, and the bed-rock was not cleaned.

A careful estimate shows that the country intervening between the head of the proposed Stewart's fork ditch and Oregon gulch divide, comprises 120 square miles of good mining ground. All of this could be worked from the ditch, and one head of water used from two to six times before reaching the river. We doubt if there is such another opening for capital in the State.

YUBA COUNTY.

Oregon Hill.—Cor. of *Appeal*, 9th: The preparations made by the Union Hill Mining Co. have not been so advantageous as they would have been if rain and snow had fallen in abundance. This company has washed a good deal of "top dirt" by means of their reservoir, which now holds water to its utmost capacity. The three undercurrents in their flume work satisfactorily.

Arizona.

Walnut Grove.—Prescott *Miner*, Feb. 26th: A large party started Thursday for Walnut Grove and Wickenburg. Among them, C. B. Genung, J M. Tiernan, and P. Smith, go back to start their arastras, being satisfied that they can work their ores with profit. Mr. Genung intends soon to erect a few stamps and run them by water-power. Mr. Tiernan has presented us with a very rich specimen of ore from the Sutler lode, at Walnut Grove. The free gold crops out all over it. John White, Fred. Henry, and others, have struck it rich at the old Placeritas, near Walnut Grove.

Colorado.

Nevada District—Central City *Herald*, March 2d: B. C. Watterman is getting the water out of the "Flack," and will soon begin to take out ore.... Whitcomb is about to commence work on the Indiana lode.... Six Cornishmen, under the firm name of Roborts & Co., are working the claim 300 feet east of the Stalker shaft, on the California lode, and are taking out very rich ore in large quantities. For a long time three of the men worked out for other parties, and supported the three who were sinking the shaft. They are now getting from three to five cords of ore crushed daily, and reserve a large quantity of select ore for smelting. They are said to have $50,000 worth of ore on the dump.... Sweetzer & Bennett have commenced work on the Bad Joe lode.... Wm. Lyons, who has leased of Capt. Phillips the claim on the Jones formerly worked by Sullivan & Andrews, is taking out ore which runs 13 ounces to the cord.... The Howke claims on the California is being worked by a party of Cornishmen on half interest. They are taking out splendid looking ore.... Judge Morse's claim on the Indian, 200 feet west of the Howke, has been leased by Cornishmen, who are getting out first class quartz for smelting.

Idaho District.—The creek miners are beginning operations. Bruno & Co. are at work at Stony Bar. John Edwards is working on the lower end of Grass Valley Bar. La Caille & Co., on Buckeye Bar, and Schwartz has been working all winter on Illinois Bar. Theo. H. Lowe proposes to begin on Monday. The indications are that more gold will be taken out this season than last. On the Seaton lode 15 men are at work, in three parties. Capt. Dean is working his own claim, No. 7, and the other two parties are working under a lease. The ore is worth $70 per ton; a small lot sold for $100. The vein is large. S. C. Bennett is working the Terrific, half way down to Virginia cañon. It is a silver lode and assays from $50 to $300 per ton. Dr. Noxen is working the Crisis lode, and is producing a fair quantity of very fine looking silver ore.

Briggs.—Same of 9th: The Co. deposited this evening 390 oz. 14 dwt. gold, valued at $7,500 currency. It is the product of three weeks' run. Besides this, they have sold 44 tons of ore to Prof. Hill for over $100 per ton, making the gross product of the mine $12,000 for three weeks work.

Cyrus Hurd has leased the American Flag property, which has lain idle for two years and a half. It consists of 550 feet, and has several shafts, averaging in depth from 80 to 267 feet. It has an engine, hoisting works, and pumps, on the ground.

A sample of ore from the Seaton lode, Clear Creek county, assayed by Prof. Burlingame, gave 414 oz. 2 dwt. silver, and 2 oz. 2 dwt. gold. A sample from the Medlay lode gave 533 oz. 8 dwt. silver, and 4 dwt. gold.

Stewart's new reduction works will be completed early in the summer,

The Bullion Consolidated and Incas Silver M. companies have been making a test hole with the diamond drill, in the mountains, to prove the value of their property. The hole was started in the end of a tunnel 650 feet long, and has been driven 417½ feet. The main lode is 800 feet from the end of the tunnel. Another vein is 600 feet. To drive the tunnel to the main vein, a distance of 1,450 feet, would have cost $72,500 at least. To bore the testing hole, will cost about $17,400.

From the Boulder *News*, March 1st: We were shown on Saturday some specimens—gold bearing—by James Pell, owner of the Sucker lode, Gold Hill district. This is worked to a depth of 30 feet, showing a 3½ foot crevice of pyrites of iron and white quartz mixed. He is taking out ore for crushing, and has six cords on top of the ground.

The Georgetown *Miner* of March 3d says the contractor who has been running the diamond drill in Ten Mile district, in the Bullion-Incas tunnel, reports that he has bored a distance o. 317 feet.

Idaho.

Items.—*Avalanche*, March 5th: Doc. Waldref is working the Richman mine. The entire length of the tunnel, a portion of which runs through a snow bank, is 200 feet. The ledge looks well.... This week we were shown a purse containing about $100 of fine bright gold dust, from the Wagontown diggings.... Twenty tons of Home Resort ore, recently worked at Minear's mill, left a snug sum to the owner after the expenses were paid.... Geo. King, of Flint, is working the Pioneer mine with a prospect of good pay.

Bullion.—Wells, Fargo & Co. shipped from Owyhee during 1869, $835,181.07 worth of bullion, coin value. The total for 1869 may be put down at a million dollars, as the aggregate carried away in private hands would bring it up to that amount. This is from only two or three mines, and most of the time but two mills were in operation.

Mining Items.—*Chronicle* Feb. 26th: The mine known as the Gold Hill is turning out one of the most valuable in the Territory. They have a 25-stamp mill. One of their tunnels is over 500 long. They have struck the ledge at a distance of between 200 and 300 feet. The level that they are running drains the mine at a depth of over 600 feet.

A gentleman down from the Middle Boise informs us that Flournoy & McCall's ditch will be completed in two weeks. Plume & Co. have 2,000 feet of lumber on hand to build sluice-boxes and a hydraulic. There is 20 inches of snow on the claims of Plume & Co. The miners expect a good season, plenty of water and plenty of ground.

From Henry May, Willow Creek, we learn that everything bids fair for a prosperous mining season. Wright's ditch is completed, and conveys 1,000 inches of water to the mines. Chinamen were at work on the Williams claims.

Montana.

The Virginia *Times* of Feb. 23d has these items: The miners in Adobe Town have piled up a very large amount of pay dirt for the spring washing.

The vein in the Green-Campbell lode was laid open on Friday last. It is 5½ feet in width, and is tapped 110 feet from the surface. Another tunnel on the south extension has been driven in 380 feet. The rock is hard. As soon as the lower tunnel strikes the lode, it will be driven along the vein, securing an unbroken development 1,500 feet.

Everything is prosperous at Bannock. Large amounts of gravel ready for washing. It will be one of the best camps in the Territory.

Same of 28th says: We learn that the run made in Naves' 5-stamp mill, near Radersburg, of 100 tons from the Keating lode on Cow creek, yielded $36.50 per ton.

During the pleasant weather, in addition to the large dumps of pay gravel along Alder gulch, there has been sluicing done that yielded $5,000 a week during all weather suitable for sluicing—and more than half of the winter has been of that character. This would give an aggregate of $30,000 actually sluiced out.

The only thing going on in Sterling is the organization of a joint stock company to prospect Hot Spring creek. Work will be commenced this week.

Helena correspondence of same, March 2d: Reports from Cedar are mixed. There is no use of trying to do anything for the next three or four months. The snow is too deep for prospecting or mining, and the chances for starvation and hardships to parties trying to winter there, are lively.

The 10-stamp water-power mill in Granite gulch will start up in three or four days on ore from the Flying Cloud, a gold-bearing lead known to be rich.

Prospects at Mill creek are good.

The Iron Rod lead, Silver Star district, owned by Stevens & Trivitt, is yielding good returns. On Monday, Mr. Trivitt deposited in bank 150 ozs. of gold retort, the result of one week's run of their 10-stamp mill.

From same of 4th: Wisconsin gulch contains 800 inches of water. The present company have expended $25,000 in prospecting. In Nugget gulch, a right hand tributary to Wisconsin, as high as $50 to the pan have been obtained, and in the latter, $15 per day to the hand.

The Montana Mining Co. have a flume 4,000 feet long. The total cost foots up $55,000. The company started work in 1865, and now own three miles of ground in the gulch, which is so flat that it has been found a necessity to put up machinery. The top loam will be run off, as there is full enough; but the gravel will be hoisted into the sluices by water-power, supplied by a ditch which taps the gulch a mile above. The bed-rock is from 16 to 18 feet, and the dirt pays an average of five cents to the pan.

Miners' Ditch Co.—*New North-West*, Feb. 25th: The ditch will be the largest in Montana. It will carry 2,500 inches of water. Work was begun in December, 1869, and will be completed in July, 1870. It is being built on the joint-stock principle. Twenty five men have been employed during the winter. The number will be increased to fifty in a few days. Two miles are completed.

Cedar.—W. J. McCormick left Cedar a week since. When he left, only one string of sluices were set. These were Jim Lore's. It was reported that in two days, from eight set of timbers, he cleaned up $300, and that the ground had prospected $1 to the pan. No. "60 below" is the lowest claim yet opened to bed-rock. At "62 above" there was five feet of snow; "21 below," prospects from 5 to 50 cents in the gravel; and "58 below"—Joe. Carroll & Co's—from 3 to 15 cents. McCormick has $4.50, which he panned himself from five pans of dirt in "54 above" and "21 below." The bars are now attracting attention. They prospect well up 150 feet above the creek level. The abundance of water in the gulch, and the heavy grade facilities for hydraulicing these, if they prove good, will give permanency to the camp. A. J. Simmons and Jack Allport purchased the bar claim opposite "88 below," for $250, the other day. It has prospected as high as $3. A great deal of prospecting is going on in the neighboring country.

Philipsburg.—Deer Lodge *Independent*, Feb. 26th: The mill suspended operations last week, but we learn will be running again in a few days. The ores so far have not turned out so rich as had been expected. The chief cause assigned is, that the persons employed to select the ore did not understand their business. Mr. Saunders is keeping a force of hands employed on the Trout and Queen lodes. Pervine & Co. will now do custom work at their mill.

Emigrant Gulch.—Recent reports are to the effect that rich diggings have been struck. For a number of years, parties have been operating there with very good success. If reports are substantiated, there is little doubt that a large number will be attracted in the spring. The great drawback to prospecting is the treaty with the Indians, which gives them a right to prevent prospectors exploring the country.

Lower California.

A La Paz letter dated Feb. 18th, says the mines and works of the old Triunfo had been transferred to a new company, and that machinery to work the rich mine of Mendosina had been shipped; also, machinery for the Codicia mine and the reduction works.

Nevada.

COPE DISTRICT.

The Mountain City correspondent of the Elko *Independent*, March 9th says: A number of very rich ledges have been recorded within the past few days. The latest is the Sultana, three miles from town, discovered by W. G. Hanks. The ledge is five feet wide, is full of black sulphurets, and is literally covered with horn silver. Next is the Cocoanut. This is two miles west of town. From an assay made it returns $3,400 in silver and $127 in gold per ton. The first eastern extension has been taken up by Stanburn & Co., who have found the ledge, and are at work on it. Next comes the Capital, owned by Cowles & Co. It is six miles north of town, and is said to be a splendid ledge; New York, owned by Savage & Co., is turning out splendidly. They are working night and day. Next comes the Bourbon, situated on Crescent hill, owned by Taylor, Norton & Co., which looks fine. Whilst I am writing I am informed that a new ledge, which looks well, has been discovered by Mr. Martin, known as the New Brunswick.

Work is progressing on the Argenta, Mountain City, Great Republic, and Crescent. The Canty mill is working Crescent rock. When finished, they will commence upon Argenta. They have not made a clean-up as yet. It might be well to state, however, that the pans have choked up more than once, so great has been the amount of amalgam gathered in them.

The most energetic company in camp is Fuller, Ferguson & Co. They own the Mammoth, Estoll, Keystone, and others in Bull Run district. Another fine lead, the Virginia, is owned by Colgan & Co. They are down 58 feet, the ledge being two and a half feet in width, the rock assaying $556 to the ton. The Pride of the West is about to be worked by Handy & Co. It is rumored that a mill has been procured by this company. Lytle & Co. are working on their celebrated California tunnel. They are now in 482 feet.

Bullion.—Monday's stage brought in three bars of bullion worth $1,800, the result of the workings of 16 tons of ore from the Crescent mine in Mountain City, by Canty's mill.

Same of 12th: A party of prospectors from the Bruno mines have found what is supposed to be the very rich mine discovered in 1864 by men from Silver City, and abandoned on account of the Indians.

Capital and Crown Point.—The Capital, four miles north from Mountain City, is seven feet in width, the quartz being charged with sulphurets of silver. The Crown Point carries a larger percentage of gold than any mine in the district.

REESE RIVER.

Mineral Hill.—*Reveille*, Feb. 26th: The mild weather has enabled miners and prospecters to carry on their work with little interruption. Claims have been developed, large bodies of valuable ore extracted, and a number of new ledges discovered and located. The machinery for a 10-stamp mill, which has lain at a depot on the railroad for some time, will be erected immediately.

Sierra District.—Same of March 7th: Already a number of tons of ore have been shipped to Austin for reduction, and have yielded from $200 to $600 per ton.

Manhattan ore (Oregon mine) roasted at the Auburn mill at Reno, showed the percentage of silver chloridized to be 93 75-100 and 93 12-100.

Latest.—An Austin telegram of 14th, says: Eleven hundred and eighty-two pounds of bullion were brought to this city yesterday from Belmont for shipment. The Manhattan mill produced last week 13,603 ounces of bullion.

WASHOE.

Yellow Jacket.—Gold Hill *News*, March 12th: The body of ore recently developed at the 1,020-foot level looks better and better to the northward. It breasts out fully ten feet in width, and the south shaft being completed to that level, with a good drift connection, the ore is being taken out that way at the rate of 50 tons per day, milling on the average $30 per ton.

Imperial-Empire.—The new 120-horse power hoisting engine is completed, and starts up this evening for the first time. Next week it will be put into practical service raising the water from the shaft, there being about 110 feet of it at the bottom.

The old upper works of the Imperial are yielding from 35 to 40 tons of $20 ore per day.

WHITE PINE.

The *Empire* of 13th says: All the mines now being developed are showing better prospects than ever. A gentleman from Treasure Hill informs us that the general aspect of things is promising. Although parties are making an effort to bear the mines in order to buy at a low figure, miners are not to be gulled, but are determined to take out ore and send it to mill. The Silver Springs smelting works during the past four days turned out 122 bars of 120 pounds each. The Alsop works are in full operation with a large pile of bullion on hand. The mines of Blue and Bullion Hills are yielding well. The usual number of mills are busy. Ore is hauled on sleds to supply them. Work will be commenced on many of the mines as soon as the storm abates.

The *News* says that Melville Atwood, the distinguished mining engineer, has arrived in behalf of an English company who are in negotiations for five of the leading mines on Treasure Hill, at a price well up in the millions.

Items.—*News* 8th: Monte Christo mill and furnaces running on Mt. Ophir ore.....9th: Twenty tons Silver Wedge ore cleaned up yesterday at Tregloan's mill, $81 20 per ton....The Alsop Works, during the few days' run since the stoppage, turned out 800 bars of bullion of 90 pounds each, or 72,000 pounds of metal....10th: The dispute about title between the Pogonip and Othello and the West Point companies, after twelve months litigation has been settled by compromise....11th: The Magary Smelting Works yesterday shipped 32,773 pounds of base bullion. The same teams took away 6,000 pounds of bullion from the Shermantown Smelting Works.

Items.—*Empire*, 8th: All the furnaces of Shermantown and Swansea will be in full operation this week....9th: It is said that the Chicago Pioneer Co. are taking steps to purchase the Tom Paine mine....10th: Forty tons of bullion are piled up at the Alsop works ready for shipment. ....Wieland smelting works are stopped; doubtless for want of proper fluxes....The Big Treasure mill runs six days out of seven as smoothly as possible. It is well managed....10th: White Pine Smelting Works advertises for 5,000 tons of carbonate ore.....11th: We saw specimens from the Buttercup mine yesterday which are equal to anything we have seen in White Pine in the way of chloride ore. The ledge is six feet wide, and shows splendid metal all the way across the face of the excavation.

The Base Metal Interest.—Both of the White Pine journals contain articles upon the importance of this interest. J. E. Clayton says, in the *Empire*, that the mines now partially explored, and showing promise, could turn out four or five hundred tons of ore per day that would yield 25 per cent. of crude bullion. He says also, that it appears probable that by the middle of summer there will be in operation at least 50 furnaces, with a capacity of a hundred tons of bullion per day; and that if the ores are properly assorted and mixed, this bullion ought to be worth $225 per ton in San Francisco or New York.

New Mexico.

From the *Press and Telegraph*, March 2d: The Chester quartz mill, commenced last November, started up its twenty-five 612-pound stamps on Wednesday, for a trial. Everything worked well. It will run on custom work until a tramway to the company's lode is built. On the Great Eastern lode, Messrs. Rowe & Young have a shaft down 45 feet, well timbered. The vein is large and the quartz looks well. Crawford, Mitchell & Co. are running a tunnel to find the Gladstone silver vein, which they lost by a cave. Vernon & Co., on the Tecumseh lode, have good walls and a wide seam of quartz. Conley & Co. are developing the Atlantic. The shaft is down 80 feet. A number of tons of ore assorted for the mill, are ready at the surface. The Floorman & Smith lode has also a quantity of quartz piled up.

Moreno.—The *News* gives these items: Frank Daniels has just completed a 25-stamp steam quartz mill. He employs 60 men in the running of the mine and mill. Mr. Maxwell is running his mill successfully.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

San Francisco, March 17, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 85
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

◆

The California Silk Manufacturing Company.—We have received the prospectus of this association, which was incorporated on the 4th instant. The capital of the company is $50,000, in shares of $100 each. The formation and origination at the present time is very auspicious, and its want and importance is recognized by large numbers of our practical business men, all of whom are in warm sympathy with the enterprise, and the most of whom believe in its success. Over one-third of the stock is already taken, and it is confidently expected that discriminating men of business will promptly avail themselves of the opportunity to become pioneers in an important enterprise, and incidentally secure their own pecuniary benefit, while they lend important aid in promoting the prosperity and trade, not only of this city, but of the whole Pacific coast as well. Office of the company, 121 Post street.

San Francisco Mining Stock Market.

MINING SHARE MARKET.

The mining share market has been characterized by unusual activity during the week under review, and the recorded transactions at the Board show a larger weekly aggregate than for many months past. Nearly all the leading stocks have been in request at enhanced rates, and, at the same time, it will be observed that very violent fluctuations took place from day to day, showing that the market has been manipulated by speculators to a very great extent, and, we may add, to the injury of not a few dealers. However, all these improvements are based upon an improved condition of the mines, of which we have some evidence in a number of claims upon the Comstock lode, and to which many look for very satisfactory developments in the future; as it is, we believe that the dullness so long prevalent in the mining stock market will not recur very soon.

Hale & Norcross—was in moderate request, at an improved price. The weekly report of ore extracted, closing March 12th, is as follows: From 175-level, 117¾ tons; 300-level, 53; 535-level, 38; third station, 54; fourth station, 69; and sixth station, 742; making a total of 1,073¾ tons: previous week, 1,027¾ tons. They had on hand 7,207¾ tons, of which 2,485 tons is low grade. At latest date, the shaft was 44 feet in depth beyond the sixth station, and extended into the ore-body.

Gould & Curry—has not been in the market to so large an extent as the previous week. During the week ending March 14th, 518½ tons of ore were extracted, showing an average assay value of $49 25 to the ton; the previous week the ore product amounted to 368 tons. The work at the 20th floor in the North Potosi shaft has been steadily carried forward, and is developing a greater quantity of ore than first indications promised, samples assayed ranging from $200 to $800 per ton. The El Dorado section exhibits an improvement over previous reports. Since the last weekly report they have carried their operations a floor and a half further, and all in ore, average assays giving $50 to the ton. So far as this body has been opened, the indications point to an extensive deposit. Last Chance and United States stopes are yielding more abundantly, and of a better quality. At the seventh station nothing of an encouraging nature has been met with, samples of the best material in the northwest drift No. 2 giving $2 50 to the ton. Owing to the hard rock they now encounter, they are making slow progress.

Chollar-Potosi—was in good request at a moderate advance. For the week closing March 11th, 1,234 tons of ore were extracted, showing an average assay value of $50 78 per ton. During this time the drift running west from the New Shaft has been extended 27 feet, making the total distance from the shaft 307 feet. The water has increased considerably, and the work will progress more rapidly for some days to come. On the 15th inst. $23,370 in bullion was sent forward to the office in this city, and car samples of this date show an assay value of $62 10 per ton.

Kentuck—fluctuated considerably, rising to $105, and receding to $80 per share. A letter of the 12th inst. states that 335 tons show a yield of $20 78 to the ton. The prospecting drifts from the Sage Brush Station and the 230-level, running west, have as yet developed nothing that will pay to extract, and unless those drifts will cut bodies of ore, the chances of any material discovery being made in the old west works will be very small. The drift running north, commenced on the Crown Point ground, 150 feet from the Kentuck south line, has been pushed to the north line of the Kentuck Company, and a cross-cut east has not developed anything encouraging.

Crown Point—has been in large demand, under a general improvement. On the 11th inst. they sent forward $7,315 in bullion. During the week ending March 12th, the 65 per cent. assay value of 405 tons amounts to $5,847 51—equal to $14 44 per ton.——Overman makes the following ore exhibit for the week ending March 13th: from the lower tunnel, 488; upper tunnel, 497; and 500-level, 74 tons, making a total of 1,059 tons; previous week, 834 tons. On the 14th inst., $14,500 in crude bullion was sent to the office in this city.——Yellow Jacket levied an assessment of $7 per share on the 15th inst.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Cultivation of Tropical Fruits.

The tropical sun distills many rare and costly juices, and produces spices, pleasant and fiery, in indescribable abundance and multitude. The variety of tropical fruits is wonderful indeed; but, as yet, very few have been *cultivated*, in the proper sense of that word. The lamented T. Starr King, in one of his inimitable addresses, portraying the miracle of the seasons—the mystery of fertility and production—the summer advancing northward, *like a spreading smile of God*, and the most helpless inhabitants of the globe living only in the brightest of that smile—referred, as follows, to the bounteous provisions of Nature within the tropics: "Every day," said the orator, "He sets a table for a thousand millions, and they are all fed on the influence of sunshine!"

The inhabitants of the Torrid Zone pay little if any attention to "cultivation." As a general thing, every production of Nature is there spontaneous. Man has, as yet, done but little to improve, by care and art, the bountiful gifts of Nature within the tropics; yet there is every reason to believe that they *may* be thus improved almost or quite as much as the native production of the Temperate Zone have been. Tropical fruits are, as yet, in their wild state, as were once our apples, peaches, grapes, cherries, and the whole family of berries. Hence, with rare exceptions, the delicious flavors for which our native fruits are indebted to centuries of cultivation, are wanting in those of the Torrid Zone.

The few experiments which *have* been made in the careful cultivation of tropical fruits have been abundantly rewarded. As a general thing, however, these experiments have been undertaken in the extreme northern limits of their native climate, or still beyond, and hence, under much disadvantage. Even the pine-apple, when carefully raised, and properly stimulated with fertilizers, in northern hot-houses, is said to acquire a size and perfection which it never attains in its original home—thus showing how much it might be improved in its native places of growth if cultivated there with the same industry and intelligence. In the gardens of the United States and of Europe, Pomona, like her admirers, appears in the refined garb of civilization; while in the tropics she still remains as a native beauty, unrefined, and requiring the aid of culture for the full development of her attractions.

The Creator evidently desires that the human race should have perfect apples, peaches, cereals, berries, vegetables, and grapes. Those inhabitants of the earth, who have submitted patiently to the penalty imposed upon the earliest trangressors, have very nearly attained this end, and have themselves improved, morally and socially, in a similar ratio. The same physical and moral work is yet to be wrought in the land of the orange, the pine-apple, the bananna and the bread-fruit tree; for the time will surely come when *all* of God's commands will be obeyed, and man will everywhere live by the sweat of his brow.

[Foreign Grapes in the Atlantic States.—The Commissioner of Agriculture says that much money, time and labor have been expended in endeavoring to make the foreign grape a success in the Atlantic States; but all such efforts have proven failures. The Commissioner thinks that east of the Rocky mountains no climate has yet been found suitable for the continued and healthy growth of the foreign grape.

Eight large forest trees have been transplanted to Chicago, to be planted around the fountain in Dearborn Park.

Points of a Good Horse.

[concluded from last week.]

In our last issue we referred to some general considerations to be taken into account in the purchase of a horse, and described at considerable length what should be sought for in the head, chest and physiognomy of this animal. In the further elucidation of the points of a good horse, we come to

The Back and Loins.

The back of a good horse should sink a little below the withers, but not too low. The croup (26, in our illustration of last week) should always be a little lower than the withers; otherwise, the animal will be pinched in his shoulders, and be both weak and unsightly. Moreover, his hinder parts will be too heavy, imparting an awkward gait and slow motion. Some horses have very long backs and necks; some very short ones. A happy medium should be sought for—inclining to length when speed is the desideratum, to shortness when strength and endurance is the object. The consideration of a "point" in a horse should always be made in connection with the general conformation of the animal, and the uses for which he is wanted. A long and hollow back is accompanied with general weakness; under the saddle the spine is thus liable to sink below its natural limits of flexibility, when the limbs will falter, and the entire machinery succumb. For general use, he had better be short rather than long, in proportion to his bulk. He may thereby lack a little in speed; but he will hold out better on a journey, and be better adapted to support weight. When a short back is properly combined with a broad chest and loins, and full behind the quarters, much strength and endurance is indicated. Such a build is essential in a draught horse, as it is more compatible with the full concentration and coöperation of the bodily powers generally. It also implies a short, quick step, enabling the animal, under draught, to husband and maintain his powers; while a long step would exhaust them without gaining anything in speed. To have the back a little arched behind the saddle is indicative of strength. Nature appreciates and employs the arch fully as much in the animal economy as man does in architecture. It is a matter of great importance that a horse should have good loins, which can hardly be too wide or muscular.

The Hind Quarters

Are literally the *propellers* of the animal, and if these are lacking in strength and proportion, no kind of work to which a horse is put can be properly performed. In order to judge intelligently upon the points connected herewith, some knowledge of the anatomy of the animal is indispensably necessary; but as we have neither space nor time to go into such a consideration, we must suppose the reader already possessed thereof, or refer him to some work devoted especially to that subject.

The most important bone in the horse, as well as in man, upon which depends strength and speed, is the *femoral* or thigh bone. This is the longest bone in man; but proportionately a very short and much stronger one in the quadruped. A horse with long femoral bones is able, in action, to throw his hind feet further forward than one with those bones short; such a motion in the hip-joint as will advance a short femoral 3, will advance a long one 4. Hence the importance of long femoral bones when stride or speed is desired. The straight and lengthy quarter, providing the length of body is undiminished, is indicative of length in the femoral—the short and drooping quarter, the opposite.

The examiner generally likes to look at a horse from the rear, to judge of his hind quarters. They should present a good volume; otherwise, he suspects a lack of constitution. The muscles should be of full size, and the joints should indicate strength to properly bear the strain which must come upon the propelling points, one of the most important of which is the hock. This should be of good size, but clean and flat, and with a clean point, standing clear of the rest of the joint. The spavin place should also be free from enlargement. The hocks should be well set down, requiring a somewhat lengthy thigh and short cannon-bone.

The Legs.

The legs of a horse should bear a due proportion, in their length and strength, to the weight of the carcass. Short, straight cannons are most desirable. While the distance from the elbow to the knee can hardly be too lengthy, that from the knee to the fetlock can scarcely be too short. The form of the leg should be flat and broad, rather than round. The sinew should stand out far behind the bone and feel terse and hard, while the space between it and the bone should feel *hollow*, as it were, and not as though filled with the soft substance technically called "gum." The only way to judge of the legs is to feel them—run the hands down and span them.

The foregoing description of the essential points of a horse are very meagre and imperfect, so far as completeness is concerned; but we think our querist, at whose suggestion they have been prepared, and those who may peruse them, will find them as reliable, so far as they go, which is to about the full limit of a newspaper article. In conclusion, and as a summing up, we cannot refrain from copying the *Atlantic Monthly's* graphic description of what may be considered

A Perfect Horse.

"In weight, she might have turned, when well conditioned, nine hundred and fifty pounds. In color, she was a dark chestnut, with a velvety depth and soft look about the hair indescribably rich and elegant. Many a time have I heard ladies dispute the shade and hue of her plush-like coat, as they ran their white, jeweled fingers through her silken hair. Her body was round in the barrel, and perfectly symmetrical. She was wide in the haunches, without projection of the hip-bones, upon which the shorter ribs seemed to lap. High in the withers as she was, the line of her back and neck perfectly curved, while her deep, obliquo shoulders, and long, thick fore-arm, ridgy with swelling sinews, suggesting the perfection of stride and power. Her knees across the pan were wide, the cannon-bone below them short and thin; the pasterns long and sloping; her hoofs round, dark, shiny, and well set on. Her mane was a shade darker than her coat, fine and thin, as a thoroughbred's always is whose blood is without taint or cross. Her ear was thin, sharply pointed, delicately curved, nearly black around the borders, and as tremulous as the leaves of an aspen. Her neck arose from the withers to the neck in perfect curvature, hard, devoid of fat, and well cut up under the chops. Her nostrils were full, and thin almost as parchment. The eyes, from which tears might fall or fire flash, were well brought out, soft as a gazelle's, almost human in their intelligence, while over the small bony head, over neck and shoulders, yea, over the whole body and clean down to the hoofs, the veins stood out as if the skin were but tissue paper against which the warm blood pressed, and which it might at any moment burst asunder. 'A perfect animal,' I said to myself, as I looked her over,—'an animal which might have been born from the wind and the sunshine, so cheerful and so swift she seems; an animal which a man would present as a choicest gift to the woman he loved, and yet one which that woman, wife, or lady-love, would give him to ride when honor and life depended on bottom and speed."

Angora Goats near Stockton.—The *Independent* says that Gov. Edwards, who resides a few miles east of Stockton, has some 800 Angora goats on his farm—few of which, however, are pure, nearly all being graded stock. A very small admixture of Angora blood greatly improves the fleece of the common goat, and the wonder is, that with the evidence before wool-growers in this State, more attention is not paid to breeding the goat.

What I Know of Farming—No. 9.

Planting and Growing Trees.

In further considering the planting and growing of trees, Mr. Greeley gives additional suggestions with regard to the economy thereof, and the points to be considered in selecting locations for timber. We condense as follows:

I. Land wisely planted with trees and fenced so far as need be to keep out cattle, costs nothing. Whatever else you grow involves labor and expenditure; trees grow of their own accord. Unlike any other product, you may take crop after crop of wood from the same lot, and the soil will be richer and more productive after the last than it was before the first. Whether wholly because their roots permeate and break up the soil during their life and enrich it in their decay, or for diverse reasons, it is certainly true that land—and iespecially *poor* land—is enriched by growing trees upon it, the evergreens possibly excepted.

II. Your springs and streams may have become scanty and capricious under a policy of reckless destruction of trees; they will be reënforced and reinvigorated by doubling the area of your woods.

III. All ravines and steep hill-sides, every acre too rocky to be thoroughly cleared of stone and plowed, any soil that is liable to be gullied or washed away by violent rains if under tillage, should be excluded from cultivation and given up to trees.

IV. Trees, especially evergreens, may be so disposed as to modify agreeably the avérage temperature of your farm, or at least the most important parts of it. Mr. Greeley planted four rows of evergreens (balsam fir, pine, red cedar, and hemlock) along a low ridge bounding his farm on the north, following an inward curve of the ridge at its west end; and those evergreens have in sixteen years grown into very considerable trees, forming an inviting shade in summer, and modifying the average temperature of the soil for some yards southward so that it is now at least five degrees higher, throughout the growing season, than it formerly was or would now be if these evergreens were swept away.

V. I firmly believe that the slope of a hill whose crest is heavily wooded will yield larger average crops than slope and crest together would do if both were bare of trees.

VI. The banks of streams so planted with trees are materially protected from abrasion by floods and rapid currents.

VII. A good tree grows as thriftily as a poor one. Many a farmer has to-day ten to forty acres of indifferent cord-wood where he might have had instead an equal quantity of choice timber, worth ten times as much. Hickory, chesnut, and walnut, while they yield nuts that can be eaten or sold, are worth far more as timber than an equal bulk of beech, birch, hemlock, or red oak. Chesnut has more than doubled in value within the last few years, mainly because it has been found excellent for the inside wood-work of dwellings. Locust also seems to be increasing in value. Ten acres of large, thrifty locust near the city would now buy a pretty good farm; as I presume it would, if located near any of our great cities. [It certainly would if located near San Francisco.]

VIII. Suggests that a diversity of trees should be planted.

IX. Wherever timber has become scarce and valuable, a wood-lot should be thinned out, nevermore cleared off, unless it is to be devoted to a different use. Destroying a forest because we want timber is like smothering a hive of bees because we want honey.

X. Timber should be cut with reference to the future. Locust and other valuable trees that it is desirable should throw up shoots from the stump, and rapidly reproduce their kind, should be cut in March or April; while trees that you want to exterminate should be cut in August, so that they may *not* sprout. Evergreens do not sprout; and I think that these should be cut in winter—at all events not in spring, when full of sap, and thus prone to rapid decay.

A Strange Shrub.—The Virginia *Enterprise* is responsible for the statement that a shoot "of the broom species" in that city, bloomed the day before Christmas, and has continued in flower ever since, without a single leaf on the bush. As fast as the old flowers drop off, new ones appear. Will it never stop?

Horse-Breeding in Alameda County.

Near the growing little village of Pleasanton, which is situated on the line of the Western Pacific Railroad, close to the outlet of the Amador Valley, is the large estate of the Martin Brothers, where immense grain fields and pastures are spread out for miles in extent. It is not my intention, however, to speak approvingly of the acquisition of large amounts of land by any one individual; I would sooner see numerous homes, where a generous culture, social worth, and schools are fostered. But I saw much here that is worthy of mention.

The Martin Brothers are engaged in breeding fine bands of Clydesdale stock, and make a specialty of the business. They have been engaged therein since 1855, and have used none but imported stallions since. They now have five imported horses from the river Clyde, Scotland, weighing from 1,800 to 2,000 pounds each. They have many fine colts from these horses, bred from mares of ordinary and of improved stock.

Accepting an invitation to go and examine the colts, I was expecting to see the usual *vaquero*, saddles, heavy spurs, lariats, etc., and was agreeably surprised to find myself among pets that came flocking around us, to be fondled, rubbing their noses or playfully nipping our clothing, without fear. This was a gratification, when I considered the mad careering of, and harsh treatment usually extended towards, young horses in California. The result of humane treatment is the triumph of mind over the brute, by inspiring confidence and affection, thus commanding obedience by the firm, consistent power of reason over animal sense.

The Clydesdale stallions have an intelligent expression and a generous, confiding look. The magnificent proportions of these ponderous animals gave me a new conception of combined strength and beauty. It was a pleasure to see such devotion and practical attention given to the breeding of really useful animals—the draft horse, and crosses suited to farm labor—in preference to the elegant, hound-shaped, fleet, but tender-blooded racers.

The Clydesdales are not suited for trotting or racing; but are fitted with a build and muscle for moderate movements, great strength and endurance. For hauling heavy loads, as quartz, timber, etc., and for draying, they are certainly superior.

Whether these horses, when pure blooded, are fitted for farm work as conducted in California, may be a matter of opinion. They could not stand the severe and abusive "knocking around," so universal on our ranches. Californians generally require everything *fast*, whether in the field, on the road, or hitched to heavy loads. Our people are also sometimes too fast for their own good, and may be too fast to properly appreciate such stock as the Clydesdale.

Be this as it may, the Martin Brothers are earnestly engaged in a laudable enterprise, and their management of young stock is admirable and worthy of imitation. The horses are grand and the colts are fine; and it is my opinion that such stock, if not above criticism, is at least above prejudice, and will eventually be appreciated. S. H. Herring.

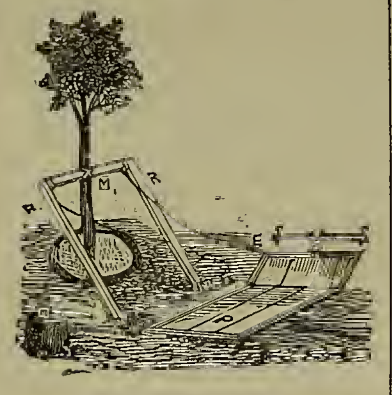
Flavor of California Fruits.—Josiah Hoopes, in his late annual address before the Pennsylvania Fruit-Growers' Society, said of his observations in California: "I may say in regard to the larger fruits, such as the apple, pear, peach, etc., that their remarkable size and beauty appeared very little short of a miracle; indeed, I was totally unable to detect old standard varieties, time and again. Their enormous size and perfect shape, together with that peculiar waxen appearance proverbial to all California fruits, was a continual picture, and will not soon be forgotten. But beautiful and large as all these vegetable productions are, there is lacking that delicious flavor, the agreeable aroma, and the richness of our less perfect, but better fruits. We search in vain for these requisites beyond the Rocky Mountains, and I very much doubt if *they* have the more preferable acquisitions, or that we would exchange our *quality* for their appearance."

Transplanting Large Trees.

In landscape gardening it is often desirable to transplant large trees, and as much of this kind of work is now being done in California, it may be of interest to many of our readers to learn of some practical way by which it can be done. No tree of over three inches in diameter should be removed without a ball of earth attached to its roots. It should also be kept in mind that all trees cannot be treated alike in transplanting. The slow-growing, hard-wood tree requires more care than the soft-wood, rapidly-growing one. The roots of the former should be taken up deeper below the surface of the earth, and a larger bulk of earth should be removed with the roots, when transplanting is done after the tree has attained any considerable size. This operation of transplanting large trees may be easily performed by means of the following simple device and directions:

Transplanting Trees.

Referring to the engraving—first dig around and loosen the tree, far enough from the butt to avoid serious injury to the roots, then place the connecting piece, M, of the standards, R, R, against the tree, as shown. Fasten it with ropes, first winding cloths around the tree to prevent injury to the bark. The inclination and length of the standards should be regulated by the height to which it will be necessary to raise the tree to place it on the "drag," upon which it is to be conveyed to its new locality. A horse, or a tackle worked by means of man-power, attached to the ropes shown, will easily raise the tree and ball of earth attached, and swing the same over upon the drag, P.



Directions for Taking Up the Tree.

The amount of earth taken up should vary with the character of the tree—whether hard or soft-wood; also with the thickness of the butt. A tree 4½ inches diameter should be taken up with a ball of earth not less than three feet in diameter; one of ten to twelve inches in diameter should retain a mass of earth of from 4½ to 5 feet in diameter. The soft-wood trees that will most easily bear transplanting are, the willow (which will require very little transfer of earth), the linden, the alder, the cottonwood, the horse chestnut, the common chestnut, the ailanthus, etc.

Hard-wood trees should be transplanted younger than the soft-wood trees, or when equal bulks of earth are to be removed the butts should be smaller. It is not safe to attempt to transplant an elm over seven inches in diameter, even with the largest bulk of earth mentioned. This also holds good for the following trees: the oak, ash, hickory, plum, apple and beech. It is not safe to attempt the transplanting of any tree which is over thirty years old.

Coniferous trees require special care. These trees often turn brown after transplanting, and remain so for an entire year, with the appearance of being dead; and yet commence growing again the second year and flourish afterwards. This is a remarkable fact which should be borne in mind.

In digging up, the ditch should be made sufficiently deep to undermine the larger central roots. These, in the largest trees mentioned, should be undisturbed for a depth of three feet. The larger roots that extend across the ditch should be cut smoothly with a knife. Before the tree is raised from the ground, the earth on the outside of the mass should be pressed firm, boards placed vertically around it, and tied on with ropes.

Directions for Setting Out the Tree.

The hole in which the tree is to be placed should be three feet larger than the ball of earth it is to receive, and should be filled in at least one foot deep—better two—with vegetable earth, before the tree is placed therein. The tree should be set at the same depth at which it originally grew, and the same side should be exposed to the north. This last should be especially observed, as without it the constitution of the tree may be seriously impaired during its after growth. The ditch surrounding the tree, after it is placed in position, should be carefully filled with rich, light earth—not manure, nor even a large admixture thereof. A small trench should be dug around the tree in the solid earth, in which the water should be placed for watering. Care should be taken that the new earth, in which the mutilated roots are exposed, is not kept saturated with water; hence the watering near the butt, in the manner indicated.

Cultivation of the Poppy.

Editors Press:—In a recent issue of your journal I observed an article upon the probable success of the cultivation of opium in this State. Being tolerably familiar with the culture of the poppy, I would add a few remarks to those which you have already made. My observations and experience are based on a lengthened residence in the opium districts of Hindoostan, as well as a brief observation of poppy-raising in Germany. In the former locality the production of *opium* is what is aimed at; in the latter *the maturing of the seed*, from which oil, hardly at all inferior to the olive oil, is obtained. Your observations as to *early* gathering of the opium and subsequent utilizing of the seed are scarcely correct in detail. The opium in India is collected immediately after the leaves of the plant commence to fall off, or, at any rate, within a very few days thereafter. The bleeding of the capsule to gather the opium, it has been shown, militates severely against the ripening of the seeds contained therein; such seed rendering but little oil, and that of *an inferior quality*, and are moreover injured for the purpose of re-production. If the plants, after the gathering of the opium, can be *irrigated* to an extent equal to say one pint or one and one-fourth pints of water to each plant, then the seeds will mature and yield good oil in tolerable quantity, say within thirty per cent. of what would have been realized if no opium had been gathered from the plant. This has been satisfactorily demonstrated by experiment at Benares.

Unfortunately, for practical purposes, the season in which the opium crop in India is gathered is dry, and thus irrigation is impossible. The opium is there gathered in the early part of the year, when no rain can be expected till June. On the other hand, if the poppy be ripened in a wet season, the crop fails, *because it requires to be ripened in dry soil.* Thus the ripening of the seed after the opium is collected, may be considered as an after-crop, requiring an amount of moisture to compensate for the primary robbing of the plant.

Unbled capsules are found to exude but little moisture, whereas *bled ones* exude it abundantly. Now, as soon as the opium is gathered, the orifices close, as it were, and the lost water can be supplied at the roots to nourish the stem and capsule.

The consideration of these facts has often led me to believe that this branch of agriculture might, as you have suggested, be made profitable in this country. With irrigating facilities, two crops might be easily raised. The crop of opium in India averages thirty-five to forty pounds per acre—one crop per year only being raised. As one acre sustains from 270,000 to 340,000 poppy-heads or more, each giving, say one grain of opium, the whole will aggregate about forty pounds avoirdupois. This, at the present value of opium in California, would yield enormous profits, and the cultivation of the most productive species of poppy, for both of the purposes named, offers to the capitalist here rare opportunities.

In conclusion, I would remark that to obtain the best results, the entire process must be conducted with care, methodically and understandingly. The poppy, after the first year, yields nearly the whole manure requisite to prevent exhaustion of the soil. The bleeding of the capsule requires great care; it must be only scratched, not punctured through. For this reason a peculiar instrument is used, which, though applied never so rapidly or carelessly, can only penetrate the outer skin of the bulb. The preparing and packing of the opium is very simple, as is also the collection of the seeds in such manner as to leave the greater portion of the plant to decay on the ground and replenish the soil.

San Francisco, March 9, 1870. J. G.

Remarks.—It will be seen from the above that our suggestions with regard to the culture of opium in this State are fully sustained by one who has had ample observation and experience to form a practiced judgment of the matter. Our correspondent calls attention to the fact that the return of the fiber of the plant to the ground furnishes ample nourishment for the soil. The plant is of a very perishable nature, and is thoroughly decomposed and mingled with the soil within six weeks after the first rains, provided it is plowed under, which should be done.

Gathering the Seed.

The matter of gathering the seed, which we inadvertently omitted in our previous notice, is as follows: Take a long strip of common cotton cloth and spread it out with one of its edges close up to the roots of the plants from which the seed are to be gathered. Then take each head separately, bend it over the cloth, and shake or whip out the seed through the natural opening in the capsule. They will come out easily and be readily gathered up, and the chaff winnowed out. Don't cut the capsule or break off the little cupola upon its top, or you will thereby waste the seed.

How to Dig Up a Tree.—When it is desired to remove a large tree with the stump, first determine in what direction it will fall most readily; then dig and cut away the roots on that side. That done, place a large log as close as possible to the butt, on the same side; then dig and cut away the balance of the roots until the tree falls across the log placed for that purpose. When fallen in that manner, the weight of the top of the tree, the log acting as a fulcrum, will tear up or break off the small roots that would otherwise still bind and hold it to the ground. The stump is, moreover, partially or entirely raised from the hole, and you have it in a position affording the greatest possible facilities for removing it out of the way or cutting it up.

Notices to Correspondents.

C. E. S., of Cordelia, Solano county, asks what is the best method to cure "stifle." He had a colt stifled, a week or two since, and it was only after much delay and trouble in consulting books and friends that he succeed in finding a person who would undertake its case—a man who happened to be in his employ at the time. This party succeeded to the utmost satisfaction of our correspondent, who will explain the process employed in a future number of the Press. In the meantime, however, he would like to hear from some other party, who may possibly be able to propose a better treatment than the one he has followed.

Chloride Bill.—As your note was received just as we were going to press, we shall be obliged to defer it till next week.

E. N. S.—Will appear next week.

San Francisco Water Supply.—Several bills have been introduced into the State Legislature for supplying this city with water. Before any such bill should be passed, the people should have the opportunity of seeing the plans proposed. It is absurd to give a company aid without having vouchers as to the feasibility of their projects and the probability of their being carried out for the advantage of the city. All such matters demand investigation and reports by competent parties before being acted on.

◆

The Santa Cruz Powder Mill Explosion.—The explosion at the California Powder Mills, near Santa Cruz, on the morning of March 11, appears to have been caused by sparks produced through friction on the part of the machinery. Of the three men injured, two are in a very critical condition, and the third has since died. The building was but slightly damaged.

◆

The new telescope at Point Lobos was placed in position about the first of the month, and has been found to more than fulfill all expectations in regard to it. By its aid a ship's signal can be made out in hazy or dense weather at almost as great a distance as could be done by the glass formerly in use on a clear day.

New Process of Treating Copper Ores.

Dr. T. Sterry Hunt has invented a new process for extracting copper from its ores, which would seem to be most valuable. It has several very important advantages over the common humid process in the economy of fuel used in the roasting, in the small amount of iron consumed in precipitation, the rapidity of the operation, and the purity of the copper obtained.

For this process the copper should be in the state of an oxide or oxide compound. If it is carbonate, it is well to calcine it to expel the carbonic acid, which otherwise would cause too much effervescence in the bath. If it is preëminently red copper ($Cu^2 O$) without much protoxide (CuO), it should also be in part calcined, and thereby partly converted to CuO, since alone it leaves a third of its copper undissolved. In the case of sulphuretted ores, these must be roasted; but it is not necessary—nor proper to carry this very far. Ores well burnt in kilns will yield up their copper without subsequent roasting, at least when not containing a very large amount of iron and sulphur. In thus roasting till the sulphur is oxidized, a mixture of the sulphate and the two oxides of copper is obtained, and it is well to add lime, so as to form insoluble sulphate of lime and oxide [of copper, else the bath will be rendered too impure by the excess of sulphates.

Having the copper in the proper state, the next step is to convert it into dichloride of copper ($Cu^2 Cl$) as far as possible. This is done by digesting with a bath of neutral protochloride of iron. Protochloride of iron reacting on the protoxide and the dinoxide of copper gives the two chlorides of copper, metallic copper and peroxide of iron, and this metallic copper is readily converted into dichloride by the protochloride ($Cu\ Cl+Cu=Cu^2\ Cl$). This dichloride is insoluble in water, but soluble in many chlorides. Therefore, a certain amount of salt is added to the protochloride of iron bath. Thus we get in this operation insoluble peroxide of iron and soluble chlorides of copper. The liquid is drawn off from the insoluble residue, and the copper precipitated by means of metallic iron.

In the ordinary process hitherto used, the consumption of iron was very large. This is owing in great measure to the absorption of the metallic iron into the solutions, and to the formation of insoluble persalts, which contaminate the cement copper. Thus, instead of the theoretical amount (some eighty pounds) required to precipitate 100 pounds of copper, two or three times as much is consumed, and the copper obtained is apt to hold from 20 to 40 per cent. of iron. This process, however, affords pure copper, and as the iron compounds precipitated by the copper oxides can be regenerated by sulphurous acid, there need be no loss of any reagent, except the equivalent of iron needed for precipitation and a little lime; and, as two-thirds of the copper is in the state of dichloride, only very little iron is needed for precipitation, say, 50 to 60 pounds of iron to produce 100 pounds of copper.

The process certainly appears to present many good advantages. We see, at present, no valid objections to the theory, and shall watch with interest the practical operations, from which we incline to expect much. Copper miners would do well to study up the subject.

◆

The Grand Musical Festival.—The financial result of the festival has been made known. The cash receipts for the five days were respectively $9,773, $13,611, $9,746.45, $9,775.60 and $2,494.65, making a total of $45,400.70. The expenses were $18,662 25, leaving a balance of $26,738 48. Madame Urso was presented with the net proceeds of the fourth day, amounting to $7,325.60—leaving a balance of $19,412.80 as the profit to the Mercantile Library.

Silver vs. Copper for Amalgamating Plates.

We last week alluded to the fact that silver-plated copper was coming into general use among quartz miners, in place of the plain copper plates heretofore used. The amalgam formed by the quicksilver on the silver surface seems to have a much greater affinity for gold than the copper amalgam. Since our last issue, Mr. Denniston, who prepares these plates in this city, has shown us a letter which he has lately received from the Superintendent of the Kanaka mine, Downieville, from which we are permitted to make the following extracts, with regard to the use and economy of these plates:

"The fifteen plates all arrived safely. I find that the plates which I washed first with a weak solution of sulphuric acid, without using cyanide of potassium, amalgamated the best. The first twenty-four hours laying in the sluices, the plates do not save as much amalgam, in comparison, as they do after again being treated and the amalgam thoroughly rubbed into all the little cavities. It will give you pleasure to learn that the first or the upper laying plates in the sluices, everyone of them, save in twenty-four hours from sixteen to eighteen pennyweights of hard amalgam, where copper plates would in the same place not have saved half of it.

I take every twenty hours, from the fifteen plates you sent me, from eight to nine ounces of hard-pressed amalgam, and this very regulalary every day. The rest of the plates—the large copper plates *above* yours and some other copper plates—give me only three or four ounces more, so that I clean up every day, from the *outside* plates of my batteries, from eleven to thirteen ounces of hard gold amalgam. This pays for my running expenses; so that the entire contents of the batteries will be surplus.

◆

State Geological Survey.

The Senate, by a vote of thirty to eight, has passed the bill continuing the State Geological Survey and appropriating $2,000 per month for two years for its support. We doubt not that the Assembly will concur. Not to keep up the survey would be to declare ourselves far behind the age and with no claim to a prominent place in the world. We do not wish to take the lowest rank in the United States with regard to civilization and science, and a decision to give up the survey would be regarded by the rest of the world as a mark of deserving this rank. In this connection we would acknowledge the receipt of Ross Browne's able letter to the Legislature on this matter.

◆

Lettres Californiennes.—H. Payot & Co. have recently published a pamphlet written by Pierre Canwet and Ch. Dnqnesnay and addressed to Emile de Girardin. Its object is to remove the opinion prevailing to a great extent in France, that California is "a country of adventurers—of bandits—a land peopled by the scum of nations." It draws a vivid picture of the past, the present, and the future, and is eloquent in its defense of this State. It is by such pamphlets as these that foreigners will have their attention attracted towards this country and get just ideas of what California really is.

◆

The Steam-Plow Bill.—The bill offering a premium for the invention of a successful steam-plow passed the Senate and now goes to the Assembly. This bill secures $5,000 *to the inventor* of such a plow. The Illinois Central Railroad has had a standing offer of $20,000 for such a plow for a number of years past. We hope the bill will pass the Assembly.

◆

Survey of Public Lands.—Mr. Sargent has introduced a bill into Congress, providing that the amounts of money advanced by settlers to expedite the survey of public lands shall be credited to them as part payment for lands within the same township.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending March 8th.

Desulphurizing Ores.—Eliza. A. Burns, Meadow Lake, Cal.

Grain and Straw-Carrying Attachment for Separators.—Byron Jackson and Benjamin F. Jackson, Woodland, Cal.

Wind-Wheel.—Charles Mehler, San Francisco.

Riding-Saddle.—Eugene Spedden, Astoria, Oregon.

Steam-Pump Device.—Martin Wilcox, Sacramento, Cal. Antedated December 30th, 1869.

Tool for Lacing Belts.—John Mitchell Stamp, Grass Valley, Cal., assignor to himself and Peter Johnston, same place.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Self-Adjusting Fence.—H. H. Margeson, S. F.—The object of this invention is to provide a fence which can be constructed at any required place, and which will accommodate itself to the conformation of the land where it is set up. This is effected by attaching the rails to the posts by means of a loose joint or connecting strap, so that any post may be elevated above or depressed below the level of the next without destroying the parallelism of the rails. In order to allow the pickets, which pass through the rails, a sufficient motion and to keep them always perpendicular, the lower part of each rail is mortised out, so as to make an angular slot, in which the pickets are free to move from one side to the other, as the rails are inclined. The connecting link or strap between the rails and posts are so made that a length of fence can be locked firmly in places, or it may be easily and quickly removed. The whole of this fence can be made in a shop or convenient factory, where it is easy to construct one by machinery; and it can then be transported to the ground and set up without trouble.

Egg-Beater.—F. Krandelt, S. F.—Laying aside technical language for the benefit of housekeepers, this invention consists of a vessel in which revolves a beater, which has two movements. To obtain these, a shaft runs through the center of the vessel, which shaft has two arms, one above the other, which hold the shaft of the beater. The cover of the vessel, which is removable, has a circular opening out in it, and the edge of this opening is provided with teeth, in which fit the teeth of a wheel fastened on the shaft of the beater. Now as the central shaft is revolved by means of a crank, the beater is carried around in the vessel, and at the same time revolves on its own shaft, this motion being caused by its wheel gearing on the toothed opening of the cover. This device will be welcomed by all housekeepers; and, as large as well as small amounts can be beaten up, confectioners and restaurant cooks will appreciate it. Bakers, too, will find it very useful for various other purposes, such as beating up the various compositions for cakes, etc.

Improved Foundation for Buildings.—A. F. Cooper, S. F.—This invention relates to an improved construction of the foundation of buildings, and especially of those which are built in countries subject to earthquakes, and consists in placing upon the solid and permanent foundation, upon which houses are usually built, a timber, on or embedded in which are springs of india-rubber or other suitable material, attached in such a manner that they will project above it. On these is placed another timber as a stringer, on which to build the house. By means of this arrangement the shock is deadened, and what motion is communicated to the building will be no more than a gentle rocking, which n do no injury to the structure.

Our Home Industries.

Ice-Making.

[CONTINUED FROM PAGE 168.]

The building and water works being thus prepared, a lot of strong twine is cut into 26-foot lengths, long enough to reach from the joists down to the floor. One end of the string is fastened to a small block (for a weight and for convenience in handling) and is then wound on the block, like a bobbin—No. 14 ounce tacks having been stuck into each side of the distributing boxes, at the distance of two feet apart. The workman holds fast the loose end of the string on the bobbin, and lets the block with the other end fall to the floor below, then winds the end of the string around one of the tacks in the side of the distributing sluice, and fastens it by driving the tack home; and proceeds thus, until all of the tacks have strings attached, reaching from the joists down to the floor, where they are held in place by the blocks until fastened by the ice.

How the Ice is Obtained.]

The object of these strings is to form a conductor for the water, which in trickling down the string soon forms a coating of ice, and in a short time each string is the center of a substantial pillar of ice, reaching from the floor to the joists, supporting itself and the building also, but, what is of most importance, presenting a large surface for freezing within a small space. When the proper quantity of water is allowed to flow down the sides of the ice-pillars, they increase in size faster at the bottom than at the top, and resemble huge icicles, with their biggest ends down and resting upon the floor, the points reaching the joists; and in this way closing up at the bottom first, and making the mass of ice nearly or quite solid. If not enough of water is allowed to run, so as to reach the bottom before being all frozen, the pillars of ice will grow larger at the top than at the bottom, leaving more or less open spaces in the ice. If very much more water is allowed on the ice than will freeze in flowing down the column, the freezing process is retarded somewhat, and if the drainage is not sufficient to freely carry off the surplus water, it is apt to collect in small pools. A little care is sufficient to guard against either of these mishaps.

The Labor Requisite.

The labor required in taking care of our present establishment is one man's time opening doors and ventilators (thirty minutes), opening plugs and regulating water in distributing-sluices (ten minutes); then on very cold nights, making the round of the house four times, (at 6, 12, 3 and 6 o'clock, for the purpose of breaking up the film of ice that collects on the water in the distributing-sluices (thirty minutes each round); closing doors and shutting off water in the morning (forty minutes); making in all 3½ hours' work for one man per day, during freezing weather. In mild weather, nothing to do.

Special Remarks.

I do not think it advisable to continue the process until the ice is in one solid mass; but when the columns have begun to unite through most of their length, and while there is some chance for cold air to circulate between them, it is better to stop off the water and allow the ice to get as cold as possible, before closing the house for summer; for it is a well-established principle, that while one side of the ice is in contact with water, the temperature of the ice cannot be lower than the mean between the water and the air while the ice is forming. So the water, when meeting the ice, being just over thirty-two degrees, if the air is down to zero, the mean temperature of the ice can only be sixteen degrees below zero. But if the ice is removed from the water, or the water from the ice, it soon cools down to an equilibrium with the air, and is consequently of so much more value for its keeping and refrigerating qualities. And another reason for stopping off the water before the mass is perfectly solid, is the greater facility with which it can be cut out and removed when required for use.

Tims Requisite, Etc.

The average time required for cutting out and loading ice into cars ready for transportation, is 1¼ hours time of one man per ton, or two car loads, of twenty tons, require three men working ten hours.

I have only to add, as one of the facts accomplished, that our buildings are now about two-thirds full of ice, with a fair prospect of being entirely filled by the middle of March.

Having stated what has already been accomplished, I will now claim an inventor's privilege of saying what I propose doing next year, and you can have an editor's privilege, and the public's, for that matter, of thinking what you choose about plans not yet put in execution. It is only, however, to put in a system of distributing pipes, for the more perfect distribution and regulation of the water during extreme cold weather (something as indicated in the patent), but with the addition of steam pipes, arranged for keeping the water pipes from freezing, and so avoid all night work. Lack of cash (the inventor's trouble) is the reason for not having done it this year.

T. McAuley.

Summit Valley, Feb. 10th, 1870.

Cranmer's Automatic Volley-Gun.

We made mention in our issue of January 15th, of an experiment at Black Point with this gun. We have received copies of the following testimonials as to the merits of the invention from high authorities. On account of feeble health Mr. Cranmer has been obliged to visit the country for a time. His address is Millerton, Fresno county, Cal.

Head Qts. Department of California.
San Francisco, January 24th, 1870.

To his Excellency, Governor Haight, Lieut. Governor Holden, and the members of the Legislature of California:

Gentlemen:—After careful examination of Mr. Cranmer's "Magazine Automatic Gun," I am of opinion that for defense of buildings, trains, or any place or point subject to sudden or unexpected attack, it will prove very effectual; especially in view of its performing all the labor of rifles as fast as could be done by a company of troops armed with breech-loaders, and this with considerable accuracy.

E. O. C. Ord,
Bvt. Maj. Gen. U. S. A.

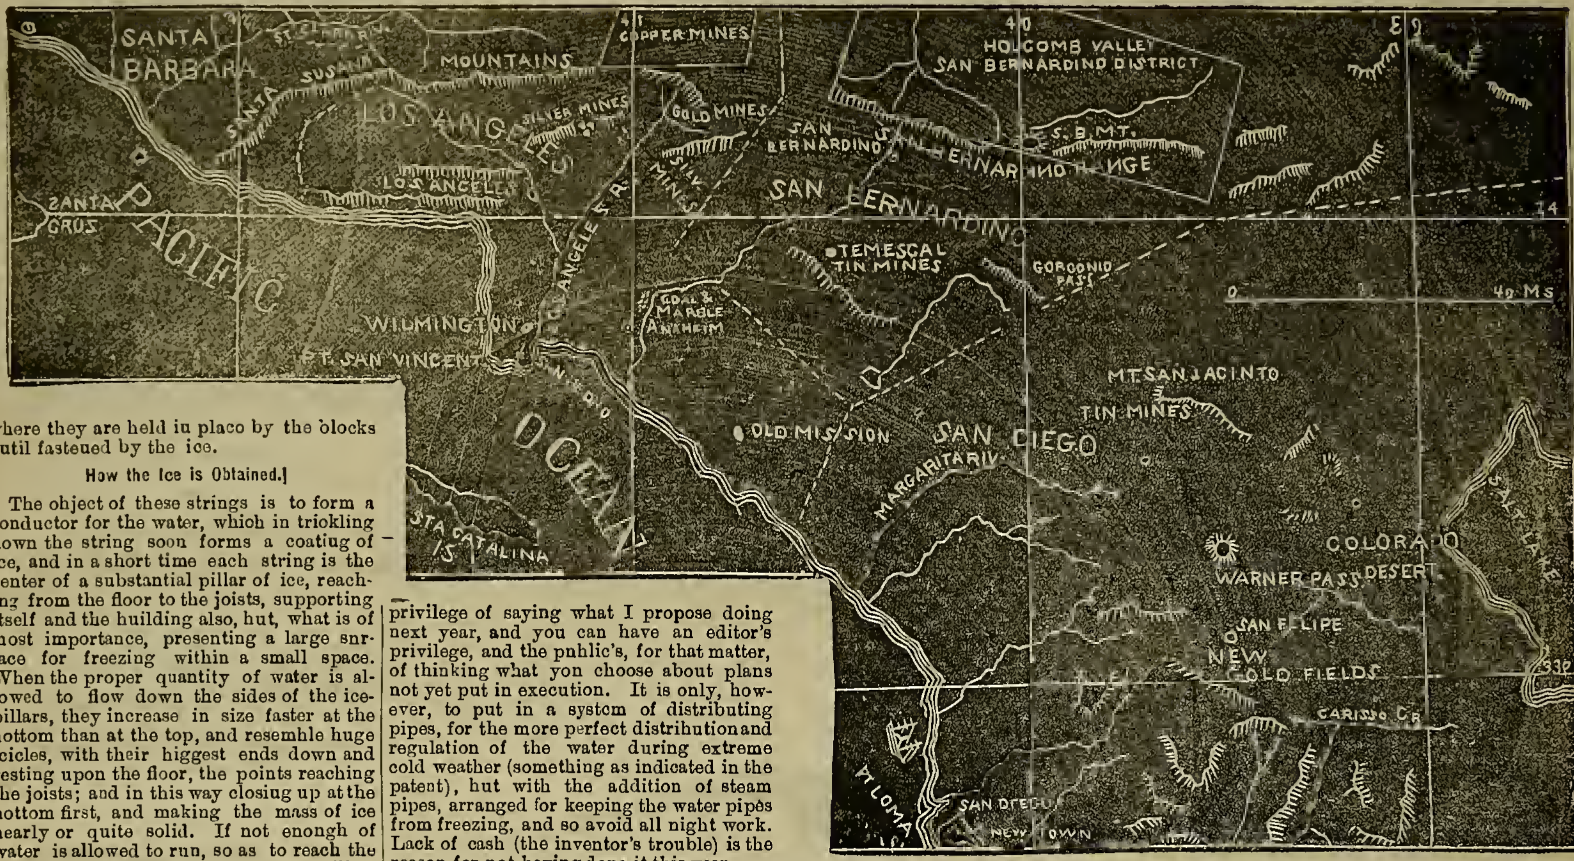
Head Qts. 2d Regiment U. S. Artillery.
Presidio of San Francisco, Feb. 24, 1870.

At the request of Mr. Cranmer I was present at Fort Point where he exhibited his automatic gun.

Without entering upon the mechanism or wherein it differs from guns of similar description, it is sufficient for the purpose of the inventor simply to state that the experiment showed the aim to be sufficiently accurate and effective for all practical purposes to which it would likely be applied. As a fixed battery, to defend the face of a work, a breach, in resisting storming parties, and on any occasion where a rapid fire is directed upon any attacking mass, Mr. Cranmer's ingenuity and perseverance is in every way deserving of encouragement and success.

Wm. H. French,
Bvt. Maj. Gen. U. S. A.

The Committee on Instruction in the Boston City Council has reported in favor of paying out of the City Treasury for all books needed in the public schools. The expense for the 33,000 pupils is estimated at about $57,000 annually.



The New Gold Fields.

We spoke last week of the new discoveries near San Diego, and gave their location. As many, however, seem to have no definite idea of the position of the mines, we give a rough sketch of the lower counties, showing their relative position with respect to other well known places. They lie near the summit of the ridge forming the watershed between the waters of the San Diego river and the Colorado Desert, nearly due south of San Felipe, and about sixty miles by the road and forty miles in an air-line from San Diego, in a northeasterly direction.

The most favorable reports are given as to the character of the country The hills are said to be covered with grass, the valleys are fertile, and there is considerable timber. The Cuynmac Pineries are but a few miles distant. The climate is very fine, but we never heard of any climate on this coast which wasn't. The country rock is a talcose slate, bounded on the west by granite and on the east running into the desert.

The mines were discovered on the 22d of February by Messrs. J. T. Gowen, H. C. Bickers, and J. B. Willis, and the vein on which a location of 4,400 feet was made was named George Washington, on account of the day. This ledge runs nearly east and west. Another, the Martha Washington, about 1,500 feet from the former and running parallel with it, is said to have been discovered, and several other ledges are reported. At a depth of six feet in the George Washington ledge silver ore is reported to be found, and a similarity to the outcroppings of the Comstock lode is seen by many. From this lode about one-half ton of rock was sent to San Francisco, and spoken of by us last week.

The discovery of the mines, and the exhibition of specimens of quartz, coated in the crevices with gold, caused a tremendous excitement. San Diego was nearly depopulated, and from other places people flocked in crowds. But, after the first reports, nothing really definite is heard. The placer diggings, as far as discovered, appear to be poor, and the prospects in general do not seem as flattering as at first thought. A district has been organized, named the Julian, and the hills are covered with prospecting parties. The report has been made that a party of Chinamen found a very fine lode, which was immediately jumped by the whites, the Chinese driven off, and three of them killed.

The last reports from San Diego say that some gold is received daily at that place, and it is reported that new rich placers have been struck. There is a lull in the excitement, however, and many await reports from friends who have gone to the mines. Another rich lot of quartz is reported taken out, richer than that exhibited. Five hundred pounds will yield from four to five thousand dollars; this is generally believed there.

As is usual in such cases, there is a great deal of discomfort experienced by the prospectors, and many who have rushed to the place are sadly in want of decent accommodations.

The map we give shows the lower counties of California from near Santa Barbara to Lower California. The region is developed to only a very small extent, and we know really neither its agricultural capacities nor its mineral resources. Most of the land is devoted to stock-raising and to the culture of grapes and of semi-tropical fruits, as oranges, lemons, figs, etc., and the silk-culture is being extensively carried on. The plain on which Los Angeles is situated is particularly celebrated for its beauty and fertility as also for its equable climate, and its vineyards and fruit orchards are quite famous. The drouth thus far this winter has been rather severe, but has not materially injured the crops. The shipments of oranges have been unusually large. More and more is being done in this country, the mines are being developed, and the prospects for the future are exceedingly bright. Our sketch shows also the more important mining regions as far as known.

Serious Accident.—Jerome Spaulding, of the Pacific Saw and File Factory, had his thigh bone fractured, on the 14th inst., by the falling of some large circular saws. Mr. S. is a brother of the well-known inventor of Spaulding's Patent Tooth Circular Saws.

California Diamonds.—We are obliged to defer still another week an interesting paper by "C. D. V." on the localities of diamonds in this State.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Oil Cake Meal.

THE BEST FEED KNOWN

For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool-growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 pr ct.; Barley Meal, 13 pr ct.; Oat Meal, 18 pr ct.; Oil Cake Meal, 22 2-100 pr ct. For life-sustaining properties for all stock exposed to sudden changes of weather, or over-driving it has no equal.

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES, a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP, there is no article of feed known that produces such fine mutton, or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this Meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the Manufactory, King street, near Third. All orders will receive prompt attention. Address—

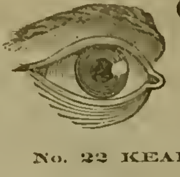
DR. ABORN,



Oculist, Aurist,
AND
CATARRH, THROAT
AND
Lung Physician.

No. 22 KEARNY STREET,
SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox, Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.

San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.

San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.

WILLIAM BEARDSLEE,
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.

Our Home Physician.

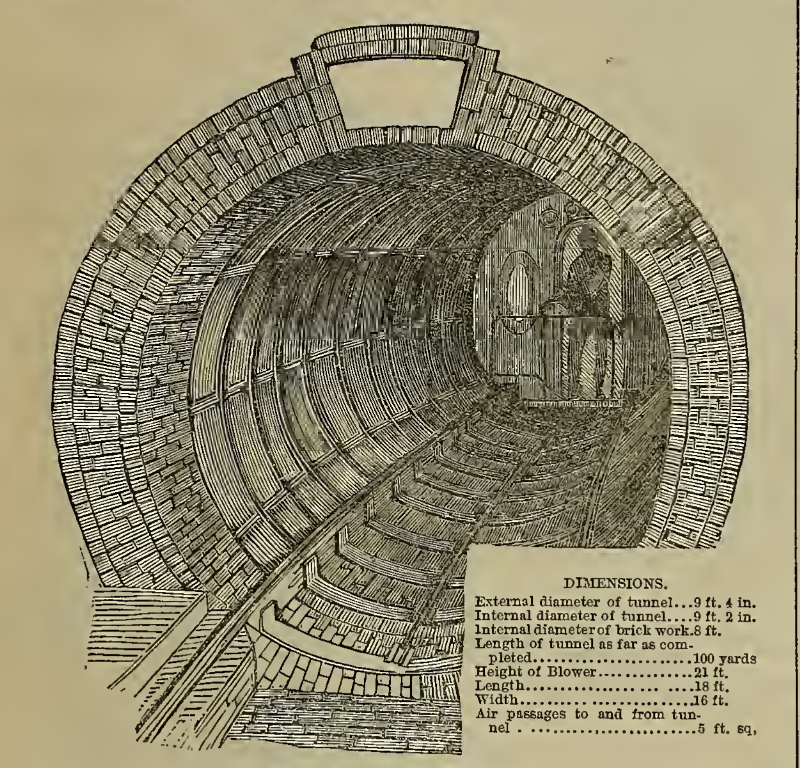
AGENTS WANTED—OUR HOME PHYSICIAN, by Geo. M. Beard, A. M., M. D., of New York. Copyrighted 1869. The only complete Family Medical Book written since 1860. Plain, practical and reliable. Its superior merits are indorsed by leading medical journals and physicians at the East and on the Pacific coast. Send for circular representing its merits. WESTERN PUBLISHING AGENCY, 411 Kearny street, San Francisco.

The New York Underground Railroad.

The construction of the Pneumatic Railway under Broadway, New York, has excited considerable comment and curiosity, stimulated in great measure by the secret manner in which, until lately, the operations have been carried on. The public press have, however, been permitted to visit the scene of operations, and the papers of New York contain descriptions of the work. Our illustrations are taken from *Leslie's Illustrated Newspaper*.

The Origin of the Tunnel.

In 1868 the Beach Pneumatic Tunnel Company was chartered with authority to lay down tubes, not to exceed fifty-four inches interior diameter, for the conveyance of letters, parcels and merchandise. The company decided that the cost of laying down two tubes of the above size, placed side by side, would exceed but little that of constructing a single tube; moreover, that the best method of construction would be to bore under the streets, below the water pipes and sewers, and to build a masonry arch to inclose both tubes. This outer tunnel has been constructed in part, and we suppose it to be the object of the company to get permission to carry passengers as well as packages. The president of the company, and its engineer, is Mr. A. E. Beach, one of the proprietors of the *Scientific American*. Mr. Joseph Dixon is superintendent of construction, and secretary of the company.



DIMENSIONS.

External diameter of tunnel	9 ft. 4 in.
Internal diameter of tunnel	9 ft. 2 in.
Internal diameter of brick work	8 ft.
Length of tunnel as far as completed	100 yards
Height of Blower	21 ft.
Length	18 ft.
Width	16 ft.
Air passages to and from tunnel	5 ft. sq,

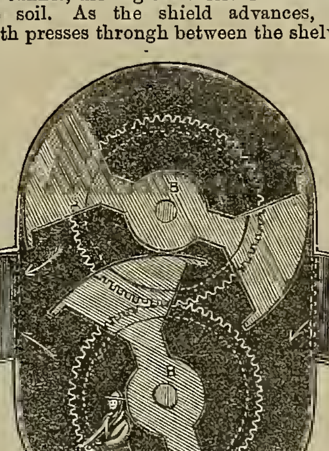
ENTRANCE TO THE TUNNEL.

The Tunnel and Station.

The tunnel is of cylindrical form and is made of cast iron plates, bolted together through internal flanges provided at their peripheries. The external diameter is nine feet four inches; the internal, nine feet two inches. The internal diameter of the brick portion is eight feet. At present, the work is being carried on through sand, and the means by which this is accomplished without the possibility of caving in, is of the highest interest. Along the bottom is laid a railway track on which runs a spacious car, handsomely furnished and well lighted. The reception room is at the corner of Broadway and Warren streets, is one hundred and twenty feet long, and occupies the entire space under the Warren street sidewalk, being lighted from the pavement. The tunnel bed here is 21½ feet below the surface of Broadway. The tunnel starts from the east end of the reception room, extends on a curve to the center of Broadway and thence in a straight line down to a point a little beyond Murray street, where the shield now rests.

The Shield or Tunneling Machine

Was designed by Mr. Beach. It consists of a large cylinder of wrought iron, open at both ends, with shelves arranged within the front end to receive the earth and prevent it from falling too rapidly into the shield; at the rear of the latter, placed around its periphery, is a series of powerful hydraulic rams, eighteen in number, all connected with a single water-pump. From the rear of the shield, and passing entirely around it, extends a hood of sheet steel, two feet wide and three-sixteenths of an inch thick. The brick tunnel is erected within this hood, which at all times covers the end of the masonry, and prevents the earth from falling upon the workmen. After a section of the tunnel sixteen inches long has been erected within the hood, the pump is operated, which causes the rams to slide out from the shield, and push with great force against the front edge of the tunnel, driving the shield forward into the soil. As the shield advances, the earth presses through between the shelves, and falls down upon the bottom of the shield, whence it is removed in barrows and cars. As soon as the shield has been advanced sixteen inches, its movement is stopped, and a new section of the masonry tunnel is erected within the hood. The shield is then again pushed forward, and so on. By means of this machine tunnels of all kinds and sizes may be quickly constructed under the streets, without disturbing the travel of vehicles over the surface. The shield may be readily moved around a curve by turning the stop-cocks of the water pipes of the rams, thus changing the pressure to one side as desired. To determine the position of the shield a compass survey is made and verified by driving a jointed rod of iron up to the pavement.



THE BLOWING MACHINE.

The Blowing Machine.

One of our engravings gives a view of the interior monster blowing-engine used by the Pneumatic Transit Company for propelling the cars or parcels. Its shell (A) is 21½ feet high, 18 feet long, and 16 feet broad. It contains two pair of wings or blades (B), which roll together in such a manner as to exhaust and compress an immense quantity of air at every revolution. The machine is made on Root's patent, and is by far the largest of its kind. It has capacity for delivering about one thousand cubic feet of air per minute. By means of this machine a current of air is driven through the Broadway tunnel, and when a car is placed therein, it is blown along precisely as a sailboat is carried before the wind. The rear end of the car forms the sail against which the air impinges. The stationary engine used is of one hundred-horse power.

The Cars, Etc.

The cars are of circular form with seats for eighteen persons. It is intended hereafter to have them 100 feet long. The tunnel near the station is enlarged so that the air can pass the cars and the speed is diminished by means of brakes. The current escapes into the street at the end station by means of a side pipe. To bring the car back, the valve is shifted, the current reversed, and the air in the tunnel exhausted. The work is to extend, according to reports, from the Battery to the Harlem river; but at the upper part of the island, where it will be carried through rock, instead of sand, open cutting will be resorted to instead of tunneling. If the tunnel is used for the transmission of packages, and not of passengers, it will be filled up with four internal tubes.

We are inclined to favor the idea of such a tunnel, and believe it will be practicable. The advantages are manifold. It relieves the streets of a considerable degree of traffic. It is free from the nuisance of smoke, dust, gas, etc. We do not know how much opposition may be brought to bear by other companies, but shall watch with interest the development of affairs.

◆

STATE LANDS.—The bill which passed the Senate March 11th, amending the act providing for the management and sale of the lands belonging to the State, approved March 28, 1868, was stated by Mr. Pendegast to be intended to accomplish three objects only. First. Under the present law if parties making application for State lands, for speculative purposes or otherwise, make no payment thereon for fifty days, they lose their rights, but a suit is necessary to declare that the lands are clear again and open to location by any other applicant. This bill makes such defaulting claims null and void without any suit. Second. It prevents the issuance of any patent for lands by States officers until the United State authorities have certified that they are clear and assent to its issuance. This is called listing land over to the State. Third. It prevents any person from obtaining more than 320 acres of school lands. These changes are as recommended in the report of the Surveyor-General, and with this explanation the bill passed.

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24w

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

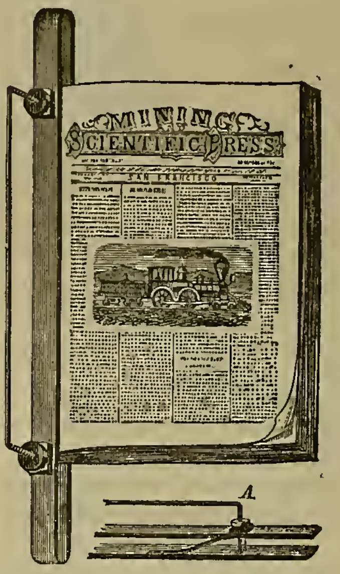
PATENTS FOR SALE.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

HOTCHKISS' CLOTHES DRYER.

This invention is for house use. It can be fastened to the wall with two screws, and removed without taking them out. When not in use the arms can be folded closely against the wall. Each arm has an iron brace to support it. This is really a "good thing in a family." County or State rights for this will be sold very low. Full particulars given on application.

BURGESS' PATENT PAPER FILE.



This is a recent patent, and one of no ordinary merit. It is light and complete, yet costs but little. In all file-holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much time and trouble. This device is easily adjusted, is not liable to tear the paper, nor let it loose. This patent is also used in combination with covers for forming music folios. Musicians who have seen it, speak in the highest terms of its value. No person can fully appreciate the Paper File or Music Folio without seeing one.

THE RANDALL RAKE.

Here is an article that we take pleasure in recommending. This patent has been for some time on this coast, but for want of means has been allowed to remain comparatively quiet. It will require from seven thousand to ten thousand dollars to handle this invention successfully on the Pacific Coast, and we would advise any one with this amount of capital to look into the merits of this patent before embarking in other business. We cannot see why it will not eventually supersede all other horse rakes. It does its work completely and is easily operated. It is so constructed that the teeth play on an iron rod independently of each other, and therefore accommodate themselves to any surface. The inclination of the teeth to the surface prevents them from raking up sand and dust with the hay, and causes them to glide easily over the ground. The driver has a spring seat to sit upon, and a simple action of the foot is all that is necessary to drop the hay. A complete model can be seen at our office, or references can be had to parties who have them in use on their farms.

OTHER PATENTS.

We have a number of small patents, for which the right of the United States or any State can be bought very reasonable.

WIESTER & CO.,

11v20 314 Bush Street, San Francisco.

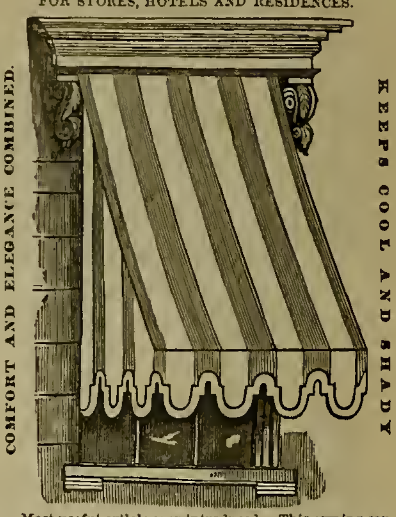
FOR SALE.

The Right of a very valuable invention secured by Letters Patent. An article of real merit, that will sell in nearly every family. Here is an opportunity for a young man to do well with a few dollars. Call and examine it. WIESTER & CO.,

10v20 314 Bush street, San Francisco.

Newly-Improved Venetian Awning,

FOR STORES, HOTELS AND RESIDENCES.



Most useful article ever introduced. This awning can be applied to the outside of any window without marring the wood-work or detracting aught from the beauty of the architecture. By the appliance of the new Patent Slide, the awning is made to come low enough to shade the longest window to the bottom, thereby protecting everything in the room from the sun, allowing a free ingress of air through the open window and giving abundance of light. Manufactured from different kinds of goods, colors and stripes, according to price and fancy, by the sole proprietors and manufacturers, J. J. WITHERS & CO., 120 Leidesdorff street, bet. California and Sacramento. T. G. ANDERSON, Agent. 11v20-3m

USE
DR. S. GIRARD SMITH'S
ARAMIRACULAS

— FOR —

RHEUMATISM, GOUT AND NEURALGIA.

CURES GUARANTEED.

Has cured Thousands. Has never been known to fail. One bottle will relieve you.

OFFICE, No. 621 KEARNY STREET.

Dr. S. Girard Smith, 621 *Kearny street.*—Dear Sir: It would be hard for me to say how much I thank you for the benefit your ARAMIRACULAS has conferred on me in curing my RHEUMATISM. I was confined to my bed when I first commenced to take your medicine, and after using ONE BOTTLE I am now able to work as well as before. If you know anything about having that afflictive complaint, you must know how good it is to be cured. I will state to those who may not believe in your medicine, that they can be convinced by referring them to me. Very respectfully, yours,

ENON HARRIS,

Everard's Auction Rooms, 527 Kearny street.

Statement of an old and well-known Physician who has practiced extensively in Europe and America.

We must admit that the many systems of medicine by which we have attempted to heal the human body, and rid it of disease, from the science of ALLOPATHY down to HYDROPATHY, how little they have succeeded, time has abundantly shown by their number of failures. In the cure of RHEUMATISM, GOUT and NEURALGIA, Dr. S. Girard Smith has laid aside the old way and adopted a system, so simple, that I must admit, is so natural and direct, that it recommends itself to all who are suffering with the above diseases. And it challenges and defies all the old methods of treatment. Although I have been educated through a regular course, and graduated in Europe, I must acknowledge the right, and also give due credit for personal benefit received by the new system as practiced by DR. S. GIRARD SMITH, which induces me to bear this testimony to its merits, for the benefit of suffering humanity.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President	SAMUEL MERRITT.
Vice-President	MICHAEL REESE.
Treasurer	J. SELIGMAN & CO.
Secretary and General Agent	W. K. VAN ALEN.

Board of Trustees—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast.

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

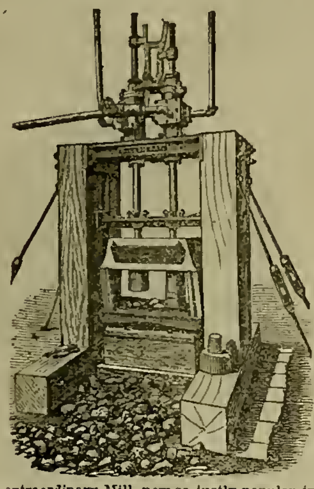
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

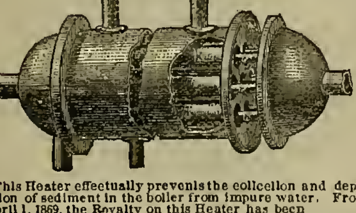
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

Crandall's Patent Spring Bed.

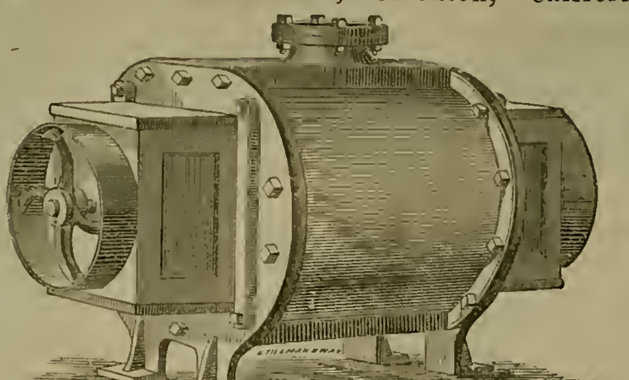
Manufactory, corner Front and M streets, Sacramento. COOLEY, HENRY & CO., Proprietors. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. ☞ Orders received at our manufactory, or at our agency in San Francisco. 7v20-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER

MANUFACTURED BY KEEP & BARGION,

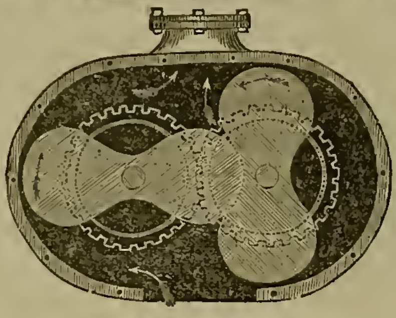
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** ☞ LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,
1v1 San Francisco.

"The Manufacturer and Builder."

A PRACTICAL JOURNAL

— OF —

INDUSTRIAL PROGRESS.

PUBLISHED MONTHLY.

NOW IN ITS SECOND YEAR.

Every Manufacturer and Builder should have it. Every Operative and Mechanic should have it. Every Architect and Mason should have it. Every Painter and Plumber should have it. Every Carpenter and Blacksmith should have it. Every Counting-room and Library should have it. Price within the reach of all.

Subscription only $1.50 per year.

32 Large Quarto Pages for 15 cents.
348 Large Quarto Pages for $1.50.
Filled with valuable reading matter.

It costs less than Three Cents per Week!

A single hint in this paper may be worth hundreds of dollars, or prove a fortune to many.

"The Manufacturer and Builder"

Is splendidly illustrated with engravings of everything new relating to manufacturing and building.

Get Your Clubs Together.

PREMIUMS.

We are induced to offer the following Cash Premiums to those who will work to get up those clubs. $5, $10, $15, $20, made in as many minutes! Read! Read! Read!

On every club of 4 names, at $1.50 each, $ 1 cash.
On every club of 10 names, at $1.50 each, $ 3 cash.
On every club of 15 names, at $1.50 each, $ 6 cash.
On every club of 20 names, at $1.00 each, $10 cash.

Including twenty and for every additional name obtained above that number, fifty cents each.

Where from ten to five hundred men congregate daily, there is no difficulty in raising these clubs. If the money be forwarded to us with a list of names, the amount of premium may be deducted from the same.

Push the good work, and make glad the hearts of your fellow-workmen.

CLUBS IN VILLAGES AND TOWNS may be procured by any enterprising man or woman. Send for specimen copy, circulars, instructions, etc., free. Take them and go among your friends and neighbors. In a half day you will often accomplish the task, and five, ten, or fifteen dollars will be earned, together with the satisfaction of knowing that you have benefited your fellowmen. Adress your orders plainly,

WESTERN & COMPANY, Publishers,

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

New Incorporations.

The following have been recorded in the Secretary of State's office, Sacramento:

Maunt ck S. M. Co.—White Pine District, Nev. Feb. 18. Capital stock, $1,600,000. Trustees: G. Hearst, Washington Ayer, Justus Struver, E. J. Ryan and B. O. Hodges.

State Publishing Co.—Feb. 19. Capital stock, $32,000, in 64 shares. Trustees; A. A. Bennett, John Bigler and Henry George.

Hale & Norcross M. Co,—March 14. Trustees: Jas. Flood (President), Jas. G. Fair (Vice President), M. J. O'Brien, Cornelius O'Connor, John W. Mackay, John Harrold, Wm. C. Hoff and Jos. Trench. Joel F. Lightner was chosen Secretary.

Valuable Ranch For Sale

NEAR HEALDSBURG.—In the fine valley of Russian River, three and one-half miles south of Healdsburg, on the west side of the river, is now offered for sale a splendid farm of 260 acres of land (minus eight by twelve rods occupied by a good school house), 100 of which is of the richest of Russian River bottom, eighty acres of which is now in small grain, not surpassed by any in the State, five acres in bearing orchard of the choicest selections, fifteen acres plowed for corn, and the remaining 160 acres is rich, yet rolling timbered land, five acres vineyard of choice selection. The Dwelling has ten rooms, not yet finished, and supplied by a good spring of excellent water, and cost above $12,000. The barns and outhouses are in excellent condition. The title is "Fitch Grant," which is undisputed. The entire farm is inclosed, about half with a picket and half with a rail fence, both in good condition. The farming utensils which are offered with or in the sale of the farm, are as follows: Five plows, two harrows, two cultivators, one Buckeye reaper; also twenty head of hogs. There are 200 redwood trees within about five miles of the premises, and wood enough to supply all the demands of the place. It is well known by all parties who have resided for any length of time on this coast, that the climate of Russian River Valley is lovely, healthy and not surpassed by that of any other place in the United States.

The reason for selling is, that the owner is getting too old to cultivate a farm, and wishes to close up his business and live more retired. The place is a rare bargain at the price asked for it.

Important to Californians.

The Ramie Plant.

This valuable fibre plant, peculiarly favorable for cultivation on the Pacific Coast, is not a new discovery, but the recently-invented methods of manufacturing its fibres into a large variety of beautiful and durable goods cheaply, is what has recently given it great popularity and significance. [Illustrated in the *Scientific Press*, January 1, 1870.]

Advantages of Cultivating Ramie.

The plant has no enemies; mildew is said not to affect it. The crop pays manifold better than cotton or any other farming production now cultivated. It is a superior fibre in every respect. It works equally well with silk and with worsted chain. It takes fast colors, and it always has a silky lustre; it surpasses all other fibres in wear.

Whoever goes into the cultivation of Ramie now, will find great extra profit in the sale of roots and cuttings in the next rain season. There is an assured market for Ramie. We are authorized by wealthy English dealers in fibres to buy all the Ramie fibre that can be procured in California for years to come.

Roots of the Ramie for sale at $26 per hundred; 20 per cent. off to the trade. Address,

HENRY HUGHES & J. S. SILVER,

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Our Water Supply.

There are several bills now before the State Legislature, providing for the introduction of water into this city, or perhaps we might rather say, for the payment of "much monies" for its introduction. For none of these bills, as far as we can learn, affords any guarantees that we shall really get a sufficient supply of a good article. We are told merely that, on furnishing the money asked for, we shall be provided with a certain amount of a liquid of whose quality we know nothing, while for the completion of the contract on the part of others, we have only our general faith in mankind to rely upon.

Before the money of the people is voted away, the tax-payers ought to have good evidence that it will be put to the best use. We have a right to demand information as to the nearest place whence we can obtain an abundance of pure water for years to come. We ought to be shown first, whether this peninsula will continue to afford such, as it becomes more thoroughly tilled, in quantities which will suffice for her increasing population. If there is danger of impurity caused by the increased amount of land brought under cultivation, or if the supply will in time be too small for the farmers and for the city, then we ought to know where we can get what we require.

The proper way to act, it seems to us, is to have a commission appointed, say by the Mayor, to examine the matter and to report before decisive action is taken. Let the supply question of the peninsula be settled finally. When it is known that we are in earnest, we shall soon get a fair knowledge of our water resources, and can determine, to the satisfaction of the people, what is best to be done. Let engineers of high standing, who have a reputation at stake, be appointed on the commission, and we shall then be able to go to work with our eyes open. But for heaven's sake let us have no blind and hasty legislation.

◆

Aurora and Storm.—Tuesday night, between 11 and 12 o'clock, the sky was illuminated by a most brilliant red light, which caused several persons to start out in search of the burning building. Wednesday morning about four o'clock we were visited by a brisk storm and such thunder and lightning as has seldom if ever been experienced within the memory of old residents. The gas lamps throughout the city were extinguished, otherwise, no damage done.

◆

"The General Law of Circulation, or Cyclical Monuments in Nature," was the subject of Prof. Le Conte's lecture at Oakland last week. In illustration of the point that the universe is a succession of cycles or periods, examples were drawn from history, geology and the sciences, in a most happy manner.

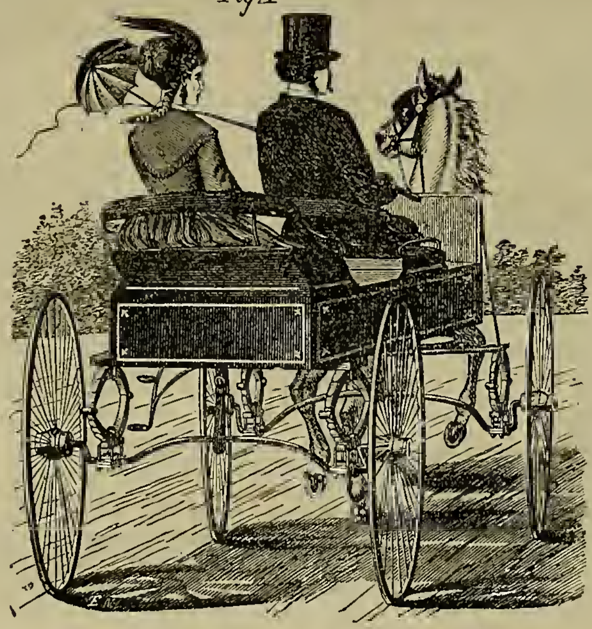
◆

Sargent's bill for the sale of placer mines has passed the House of Representatives.

Jackson's Patent Oscillating Wagon.

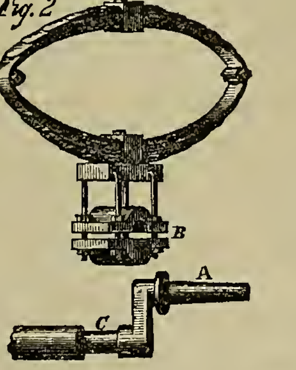
In the present age of the world we are continually introducing measures for smoothing the pathway of life. New methods of creating comfort and pleasure are being continually invented. Our houses are more luxurious, our garments finer, our food better than ever before. Especial advances have been made in the convenience of traveling, and a ride of several thousand miles across the continent is to many a real pleasure trip. So, too, we are improving our roads and streets, using superior pavements, and in other ways rendering lighter the labors of the dumb creation while we increase our own comfort.

Fig. 1



SAMUEL JACKSON'S PATENT OSCILLATING WAGON.

Fig. 2



And, in this connection, we are reminded how, while adding to our personal convenience, we are led to give more heed to the claims of humanity, and to see more clearly how it advances our private interests to look more closely to the welfare of the animals which toil for us. Indeed, it is a wonderful provision of Providence which has so constituted affairs that our selfish desires and our nobler impulses both tend in the same direction, or, in other words, that what is really for one's private advantage is also for the benefit of somebody or something else; the reality of which truth is every day becoming better exemplified.

We give this week an illustration of an invention which promises increased ease and comfort for both man and horse. It is an ingenious improvement, which permits of application to all kinds of wagons, trucks and other vehicles, and is especially important for those without springs. It consists in securing the axle to the body of the vehicle by movable attachments placed below the axis of the wheels. Crank axles or straight axles, with bars or arms, or any other contrivance by which the object can be obtained, may be used.

In Fig. 1 is shown a carriage with the improvement (with crank axles) attached. In Fig. 2 is shown the method by which this attachment is made. Here the springs are at right angles to the axles; but the position of the springs may be varied without affecting the principle in any way. The ordinary journal upon which the wheel runs is denoted by A. B is the box attached to the lower part of the spring in the manner shown in the engraving, or in any other manner specially applicable to the particular vehicle upon which it is desired to put the improvement. C is the journal which works in B.

The motive power being applied *above* B, when it is first brought into requisition in starting the vehicle, the load is swung forward of the axis of the wheels, giving a lighter draft and easier motion than is obtained in the common way, while the oscillation of the wheels will ease every part of the vehicle, and relieve the horses of the jerks and strains so common to all fixed axles. This oscillation has been tested by weights, over an obstruction, on a model with wheels eleven and twelve inches in diameter. The crank of the axles was 1½ inches, the obstruction 1¼ inches high, and of sufficient length to chuck the front wheels. To draw the model over the obstruction, there was required a draft of eight pounds with fixed axles, and of six pounds with oscillating axles, giving a positive gain of two pounds, or twenty-five per cent., with these last. The greater the obstruction the greater is the oscillation, and the greater the gain, other things being equal. On smooth, level ground, the oscillation is smaller, and on uneven, heavy or sandy roads, the gain is greater, where it is most needed.

A wheelbarrow with this improvement, with a wheel 19 inches in diameter, the crank 4¾ inches, when passing over an obstruction 2¾ inches high, required a draft of 19¼ pounds. With a fixed axle, 33¼ pounds were required, showing a gain of considerable more than a third where this device was used. Had the wagon, in the case given above, had the same proportion between crank and wheel, it would have had a proportionate gain.

The improvement thus offers the advantages of less power required, and hence a possibility of greater speed if necessary, of greater ease, and of less violent shocks, and, therefore, of greater durability of the vehicle. The inventor has at his place a full-sized wagon with the improvement, which may be inspected and tested. For further particulars address Samuel Jackson, No. 149 High street, Newark, Essex county, N. J.

◆

We made mention in our summary, at the time, of the settlement by compromise of the dispute about title between the Pogonip & Othello and the West Point mining companies at White Pine. The litigation lasted a year, but finally the parties came to terms, the West Point Company gaining largely by the settlement. This was brought about in a large measure by Mr. Robert Barton, Superintendent of the latter company, and to his perseverance, energy and ability, his company are heavily indebted.

◆

Quails for Nevada.—Mr. R. N. Riotte, according to the Reese River *Reveille*, has had a number of California quails taken into that neighborhood to be turned loose for propagation. The idea is an excellent one. There is every reason to believe that bird will flourish there, if the hunters will let it alone for a few years. We trust there may be others in various sections of the wide State of Nevada who may be induced, by this example, to manifest a similar degree of public spirit.

◆

The Sutro tunnel was in 846 feet at last accounts, and progressing favorably. Mr. Sutro is at Washington, where the bill before Congress unfavorable to him has been squelched.

◆

Mr. Oates' bill compelling two shafts to be built in deep quartz mines, seems on the point of being strangled.

Communications.

California Diamonds.

[Written for the Scientific Press.]

Diamonds are said to be found in many parts of the United States. A theory is entertained in some quarters that, wherever gold is found, diamonds may be looked for. Partisans of this theory maintain that diamonds abound in California, but have thus far been neglected by miners through ignorance of their value. When first dug up, the diamond is covered with an opaque crust, which conceals its brilliency and its crystalline form. Such pebbles might lie in every field without being detected. There are a few authenticated instances of diamonds occuring in this State, in the ancient auriferous gravel deposits, but as yet, only very few of any size or value have been found. The following are the localities where they have been discovered:

Butte County.—At *Cherokee Flat*, in the sluice-boxes, after washing large quantities of auriferous gravel, several have been discovered. One diamond found was valued in the rough at $50.

Nevada County.—At *French Corral*, in the sluice-boxes, at various times, a few have been taken.

Placer County.—At *Forest Hill*, a few small ones have been found in the same way.

Amador County.—Near *Fiddletown*, a few have been found in the auriferous gravel a few years ago. At *Volcano*, in a formation described by Prof. Whitney as "ashes and pumice cemented and stratified by water."

Klamath County.—In lower Trinity, near its junction with the Klamath, with the finely-divided platinum. Discovered by Professor Wöhler, of Göttingen. (See page 162).

Undoubtedly there are numerous other localities where their occurrence has as yet escaped notice. According to some remarks made by Professor Whitney, some time ago, there are from fifteen to twenty different localities at which diamonds have been found in the course of washing for gold. The largest diamond yet found in the State weighs 7¼ grains.

Formation of Diamonds.

In this connection, the following, from *Cosmos*, will be of interest to readers of the Press:

Researches on this subject have lately been made by Messrs. Goeppert and D. Brewster. The black diamond of Bahia is, according to Mr. Goeppert, a mixture of amorphous carbon and diamond. M. Liebig's experiments on its combustion also agree with this statement. It often happens that the diamond incloses other crystals; iron pyrites, particularly, have been noticed in it by Mr. Hartwig. Sir David Brewster calls attention to the microscopic cavities existing in this as well as in other gems, as in the topaz and emerald. These cavities are found to be often very numerous in certain dark diamonds; they thus dispersing the rays of the light, are therefore of no value in jewelry. Mr. Goeppert remarks that the diamond must have originally possessed a certain plasticity; we notice, in fact, in a diamond belonging to the Emperor of Brazil, the impression yet of a sand grain. The black as well as the crystallized white ones bear also the signs of analogous impressions produced by foreign bodies. Some investigators believe to have recognized the cellular tissue of plants in the ashes resulting from the combustion of this gem. Mr. Goeppert, however, has not yet detected with certainty any traces of organization, either in the diamond or in its amorphous form, the plumbago. As to the question so often discussed, whether the diamond be formed by platonic or neptunic action, the latter naturalist is of the opinion that the first hypothesis is scarcely admissable, the experiments of Depietz having shown that the diamond is changed into a kind of coke whenever exposed to the intense heat of a galvanic battery. The second hypothesis, attributing its formation to neptunic action, is sustained by the authorities of Newton, Brewster and Liebig, being also that which is best in accordance with all that is known about the gneiss, itacolumnite, and the metamorphic rock in which it is found. The character of these rocks, however, do not allow us to attribute to them a plutonic origin.

Alumina-Soap—Its Use, and Way of Preparing it.

[Written for the Scientific Press.]

Editors Press:—The alumina-soap is quite insoluble in water; and for a long time the chemists have been of the opinion that it is equally insoluble in fat oils, until it was found out, a few years ago, that it will readily dissolve in these if properly treated and all the points observed which I will explain hereafter.

The alumina-soap does not change the color nor the transparency of the oil in which it is dissolved. This solution can be mixed with tallow and other kinds of fat, also with beeswax, resins, etc.; and these combinations distinguish themselves by their toughness, elasticity, and also by being impermeable by water. Resins, by these means deprived of their brittleness and acquiring a certain degree of toughness, will be found useful for a good many purposes, and so will the other mixtures above mentioned.

Modus Operandi.

Dissolve good soap in four times its weight of hot water, and dilute it with ten to twelve parts more water. Then prepare a solution of alum in twelve parts of water, and add the latter solution to the first one by degrees, and constantly stirring as long as precipitation continues. After the alumina-soap is properly precipitated, strain it through muslin, and wash it with water several times on the filter. Then dry it in warm air. It has to be used for dissolving before it is freed of the last particles of moisture; and according as more or less oil for the solution is used, we can obtain substances of greater or less consistency. One part of alumina-soap with two parts of oil, in a glass vessel, which is put into a sand bath, heated for some time at 70° to 90°, Réaumur, and often stirred until perfectly dissolved, will form a jelly after cooling.

Rules to be Observed.

1. Use good and, if possible, fresh soap. 2. The water for dissolving should be distilled or rain water. 3. Clear the soap solution by filtering or settling. 4. The solution of alum should be clear. 5. Separate the alumina-soap from the fluid immediately after precipitation. 6. Wash it with distilled water. 7. Do not dry the alumina-soap on hot plates, but freely suspend it in a sieve. 8. Do not keep it long before you dissolve it in the oil intended for the purpose. This seems to be the principal reason that the older chemists did not succeed in dissolving it, because most likely they kept it too long, until it lost this property. 9. Use pure and clear oils. 10. Do not heat the solution over 90°, Réaumur, or else it will assume a darker color.

If all the above points are observed, the solution so obtained will be clear and transparent.

E. Pique.

Interesting Scientific Discovery.—Scientific research has lately revealed the fact that tubers, such as the pear, lemon, gooseberry, etc., maintain regular fluid currents, something similar to the sap currents of trees. In the potato, the current is found to be passing from the center to the circumference; while in the pear, lemon and gooseberry, the current is from the outside to the center. Examinations have also been made upon flowers and leaves—as rhubarb, peonies, dock, water cress, grasses, oak leaves, etc. These examinations are still in progress, and the investigator remarks that his experiments "are enough to set one thinking, but that it would be premature to reason upon them at present."

An excellent material for uniting water pipes is said to be prepared by combining four parts of good Portland cement and one part of unslacked lime, mixed together in small portions in a stout mortar, adding enough water to permit it to be reduced to a soft paste. Pipes thus united have been in use more than six years without any leak.

Sketches of El Dorado County.

[Written for the Scientific Press.]

Editors Press:—About the first of February the 10-stamp mill of Shephard & Co. was put in operation near their quartz lead on Oregon Hill. In a former letter, I alluded to this claim, which is said to be a good one, but none know its value but Shephard & Co. I should have particularized more fully concerning this discovery, but it was said that there were vultures hovering over, ready to pounce upon it at the first opportunity, and a favorable word dropped would have been likely to have hastened their descent.

Legal Troubles.

But that descent was made on the second, in the shape of an injunction, issued by Judge McKinstry, of your city, restraining Shephard & Co. from further extracting quartz from the mine, and claiming damages in the sum of $50,000.* This county is remarkably unfortunate in one particular; there is seldom a claim discovered worth working, but from one to twenty adverse claims or titles are set up, either to black-mail or to get possession by *strong* witnesses. Such clouds piled on to new discoveries, or old prospect holes, deter capitalists from coming here to invest in or work mines. Governor Blaisdel visited here some time ago, with the intention of investing several thousand dollars in prospecting for quartz, but he found so many pretentious titles to all outcropping quartz veins, that he left to invest his means where there would be less chance of jayhawking him.

That persons should abandon a claim and leave the country, for three, five, or seven consecutive years, and return, only when some industrious person, more worthy than themselves, may have discovered paying quartz or gravel in the vicinity of where they had prospected, and claim the discovery, is ridiculous in the extreme.

Unless this injunction is dissolved, or a receiver appointed during the pendency of this trial, some thirty men, most of them with families, will be thrown out of employment. It is hoped their injunction bond is better than white paper.

Dickerhof & Goen Mill.

The 10-stamp mill of Dickerhof & Goen, built by Mr. Jess, was put in operation the last of January, and is crushing some thirty-five tons of gravel every twenty-four hours, which pays from one to five dollars per ton. The power is an eight-foot hurdy-gurdy wheel, with a nine-inch face. The buckets are raised above the face of the wheel, and resemble the Spaulding circular mill saw. The water surface of the buckets is only three inches square. The pressure is 220 feet, conducted through a seven-inch pipe, and driven against the wheel through a seven-eighth inch nozzle, the wheel standing in an open frame, and as soon as the water has spent its force, it leaves the wheel, and, therefore, no dead weight of water is carried on by the wheel. This improvement was put in practical operation by Mr. Jess, the builder. The water required for propelling the ten stamps, of 450 pounds each, is twelve miners' inches—*i. e.*, the water that passes through a throat six inches long, and two inches deep, with a five-inch pressure, costing the proprietors $7.20 for twenty-four hours. Shephard & Co's quartz mill, with 600-pound stamps, and water for the batteries, requires eighteen inches.

Water and Steam.

Let me here make a calculation between this motive power and that of steam.

STEAM.	
Two engineers at $4	$8.00
Three cords of wood at $5	15.00
Incidental expenses in mining, say	50
Interest on difference in first cost (say $3,000) and wear and tear of machinery (say 2 per cent. per month)	2.50
Total	$26.00
WATER.	
Say 16 inches, leaving 2 inches for battery, at 60 cents	$9.60
Difference in favor of water per 24 hours	$16.40

With such cheap power, quartz and gravel which cannot be worked at all by steam would pay owners handsome dividends worked by this power. Hangtown ridge, which is some 400 feet high and seven or eight miles in length, will, in time, find its way pulverized to powder by this cheap power, winding its way along the bottom of Hangtown creek to the American river, thence into the Sacramento, to lodge, perhaps, on the "Hog's Back."

Revival of Mining.

The quartz interest has revived since the discovery made on Oregon Hill, and every day may be seen Jew and Gentile, with pick and pan, starting for some location in search of the rock filled with *oro;* returning at night tired and discomforted, many declaring they will never try it again; but after a night's rest, like the gamester who has lost, is ready to try his luck again. Some rich quartz veins have been discovered; Van B. Hooker, on Cedar ravine, among others, but how extensive, time alone must determine. The want of a full supply of water alone prevents this from being one of the most productive mining towns in the State. I am told by the water agents on the South Fork canal that 10,000 inches of water could be disposed of as easily as the 1,000 now furnished by that corporation. R. R. and J. Craig's hydraulic globe nozzle (the patent for which I think was procured through your agency) has been introduced here lately, and J. H. Nash appointed agent. Some twenty or more have been sold, besides several yet to arrive to fill orders. None who have used them will part with them. Wonderful success is claimed for them.

I intended to have given a few items concerning hydraulic mining at Newtown, Spanish and Reservoir Hills, and other places I have visited lately, but must defer it for the present. [We hope our correspondent will give us some full accounts of these operations, the methods used, etc.—Eds.]

E. N. S.

Placerville, March 8th, 1870.

Wet Crushing.

[Written for the Scientific Press.]

Editors Press:—In connection with the plan of settling and pumping back the water used in crushing ore, in order to avoid loss, recently patented, and long since practiced by myself and others, I would call attention to an article by William Skey, in the *Chemical News* (Am. Repr., June, 1868), in which is pointed out the effect of saline matters in causing the precipitation of clay held in suspension by water.

As ores generally contain some clay, which, by thickening the water, obstructs settling, it might be advantageous to use, in crushing, a solution of salt or lime (when the latter is not obnoxious to the subsequent treatment of the ore).

That Article.

I have just seen your issue of the 5th inst., containing the letter of "J. G." The editorial remarks, on another page, present my own views so fully that it is unnecessary to add to them further than to assure all your correspondents that I have no personal feeling or conflicting interest whatever in the matter, but am moved solely by regard for the legitimate interests of the science of which I am an humble, but earnest, student and practitioner. * * *

The only point worthy of notice in "J. G's" letter, is the intimation that the operations of the Triunfo Co. are not profitable. If this be so, the fault is not in the process used, as is proved by the fact that the same kinds of ore, in some cases from the same mines, were worked with profit in the Picacho mill, at a cost of $18 per ton. As "J. G." states that the Sheba ore presents similar difficulties, this fact will, perhaps, serve to indicate the range within which it could be worked with profit, allowing for difference in price of labor, etc. * * * What I intend by saying that all ores can be worked, is, to refute the statement so often heard, that "the ore would pay, but it is so rebellious that they can't get the silver out."

As to preventing the formation of antimoniate of silver, there is some authority for saying that it can be done in a measure. It appears that the antimonious ores of the Reese River district are worked to 80 per cent. Can "J. G." tell us in what proportion this salt is formed in a properly conducted roasting, and is he sure that, if formed, it is quite irreducible in subsequent amalgamation? * * *

C. H. A.

February 25, 1870.

---

* Since the above was written, G. E. Williams, Esq., attorney for defendants, telegraphed from San Francisco for Shepard & Co. to resume operations. This news was joy to the many men employed.

Mechanical Progress.

The Wheeler Steel-Iron Process.

We condense the following from the *United States Railroad Register*, of Feb. 19th: "There have been apparently insurmountable difficulties in the way of successfully and cheaply combining iron and steel in such masses and proportions as the various railroad and mechanical interests require. We have within a few days examined a process discovered by Mr. E. Wheeler, of Philadelphia, which seems to fill all the conditions for working the two metals into successful combinations. Mr. Wheeler has for some time been engaged in experiments. Starting with the theory that there is no difficulty in uniting the two, providing that the steel be brought to a "welding heat" simultaneously with the iron, and that the steel while being so heated, cannot suffer injury or "burning" if kept from the direct action of the flame and oxygen (as when melted in a crucible), he reduces it to practice by the simple device of completely encasing the steel with iron during the entire process of heating and reduction. The steel is thus effectually protected from the decarbonizing effects of excessive heat, and can be safely heated to a perfect welding state in the usual iron furnaces, without flux of any kind, and in this condition may be rolled down and manipulated as readily, and at the same speed as iron, in ordinary rolls.

We have seen the highest grade of cast tool steel, thus enclosed, and filled with iron, subjected to the intense heat of a heating furnace, and then rollled down into bars at the rate of five hundred feet per minute, and the steel, though perfectly welded to the iron, presented the same bright, clean fracture when broken, as in the original state, and would harden as readily in a water bath. Mr. Wheeler showed us a car axle rolled by his process, at one heat, consisting of a core of iron surrounded by a tube of steel and both in turn by a shell of iron, the whole being as solid and perfect as a homogeneous mass of iron. This plan gives a steel journal, while the iron core and shell secures strength and prevents fracture or breakage of the steel.

The practical uses to which this method can be applied are innumerable. By it any grade of steel may be used and be united to iron in any shape or proportion. Mr. W. is making combination in merchant bar forms, for set screws with steel center, horse-shoe bars with steel face, carriage tire with steel corners, etc., etc., and we learn that several prominent rail manufacturers are about to apply this process to the making of steel-headed rails, for which it appears peculiarly adapted."

New Instrument for Draughtsmen.—At a recent meeting of the Polytechnic Association of the American Institute was exhibited an instrument which is thus described by the *Artisan:* "The instrument is designed to facilitate the cross-hatching required in making sectional views. Two parallel bars, intended to be placed in proper position upon the paper, are provided, one with a finger-lever and spring-pawl, the other with a ratchet on its upper surface, and with a hinged horizontal arm adjustable at any angle to its bar; by working the lever on one bar the pawl connected therewith is caused to act upon the ratchet of the other, and thereby advance the same, together with its angular arm or rule, to the distance required to form the spaces between the oblique lines of the cross-hatching, such distance being, of course, proportioned to the extent to which the finger-lever and its pawl is depressed."

Powerful Turbines.—The machinery of the Mastodon Mill, Cohoes, New York, consisting in part of 1,486 looms, is all driven by three turbines which possess an aggregate capacity of 1,100 horse-power. The *American Odd Fellow* says: "The perpendicular shaft of each turbine is connected with the main shaft by beveled gear, and the united power exerted, if so applied, would reverse the motion of the great Burden water wheel at Troy, and drive the machinery of a good sized manufactory besides. The shaft is supported by three granite abutments, and forms the axis of six ponderous driving pulleys, twelve feet each in diameter. The immense belts which radiate to all parts of the building are in keeping with the massive pulleys and gearing. These are each two feet wide, and the longest one reaching to the fifth story measures nearly two hundred feet."

Road Steamer for Two Persons.

The Engineer illustrates a small "steam velocipede" of recent invention, which it thus describes: "The boiler contains three-quarters square foot of grate surface. The coal bunkers are on each side. The driver's seat is long enough to contain two persons. The driving wheels are four feet in diameter, and have steel tires one-quarter inch thick; on to the boss of each driving wheel is fixed a grooved driving pulley fourteen inches in diameter. The main axle is cranked to clear the tank, and each driving wheel runs loose on it. The main bearing springs are fitted with rubber washers; there is also a brake on each wheel worked by a foot lever. The cylinders, two and a half-inch diameter by four-inch stroke, are fixed to the top of each bunker; there is no reversing gear, but a single eccentric working forward and cutting off at five-eighths. On each end of the shaft is fixed a friction cone carrying a grooved pulley six-inch diameter, and from this pulley motion is communicated to the driving wheel by a half-inch gut cord. The single leading wheel is carried in a fork fitted with a volute spring and rubber washer, and governed by levers. The boiler is fed by a No. 1 brass injector placed through the foot-plate. As regards speed, it could be guaranteed to run 100 miles per day of ten hours over any high road in England."

A Gun-powder Hammer.—A modification of the gun-powder pile-driver, which was described in the Press some time since, has been invented by Mr. Justice of Philadelphia, in the form of a forging hammer. It may be briefly described as follows: The hammer is released by the workman, and falls, driving its plunger into a cylinder, upon the top of a movable anvil, wherein a charge of percussion powder is placed. This explodes, and causes the anvil to descend with force upon a stationary anvil, while the hammer is at the same time thrown upwards, where it is retained by mechanism until again released by the operator.

The Woodward Gas Carbonizer.—This contrivance for increasing the illuminating effect of ordinary street gas, by adding carbon to it near the point of consumption, resembles externally an ordinary gas meter. Benzole is filled in at the bottom, and is taken up by cotton wicking, which passes over a drum in order to expose a large surface to the gas. This enters at one side, and, mingling with the vapor of the benzole, is carried with it to the burner. Dr. Chandler, of Columbia College, New York, says that 7,000 feet of gas with one gallon of benzole, are equal to 11,000 feet without it.

The Advantages of Band-Saws.—The points claimed are: That "the dust is all carried downward, leaving the top surface clean, enabling the operator to follow the line with precision. There are no slides nor reciprocating parts, and consequently there is no jar or vibration. The manufacturer is not, as in reciprocating machines, limited to a minimum weight of those parts of his machine which he would otherwise make the strongest. The motion is rotary, the bearings those of plain shafts, and the speed much slower than that of the spindles in other wood-cutting machines."

Popper's Claim Denied.—The anti-incrustator, or "mud-collector," credited to Herr Popper, and noticed in our last, is claimed by William Whittle, in a letter to *Engineering* for February 18th: He asserts that he patented it two and a half years ago; that Popper mistook the *mud*, in the cut illustrating it, for *pebbles*,—which possess no advantage whatever; and that he will receive legal notice against the use of it in any manner.

Forged Wood Screws.—This is a new English invention, illustrated by *Engineering* for Feb. 4th. The forging is done by machinery, as cheaply as the cutting of ordinary screws by machinery; and the result is a much stronger article, inasmuch as the fiber of the iron is not destroyed as in the case of cut screws,

Scientific Progress.

The Pentagonal Symmetry of Metalliferous Veins.

The New York *Engineering* for March 1st contains an article by Julien Thoulet, M. E., upon the applications to mining which have been recently made of M. Beaumont's theory of the pentagonal symmetry of the earth. This theory, although its author is a scientist of acknowledged merit, is generally considered a fanciful one. M. Beaumont has again and again found it necessary to modify his figures and multiply his lines, in order to include the facts. We will, however, briefly state it. First suggested by the observation that the mountain ranges of Europe compose a series of definable groups, it holds that similar groups over the whole surface of the earth, form together a regular geometrical figure; and that this figure is that formed by twenty equilateral spherical triangles, which occupy the entire surface of the sphere, and are grouped in fives about twelve distinct points. The meridian lines of these triangles divide each of them into six scalene triangles, making in all 120, which may be so grouped as to form twelve equal spherical pentagons. Hence the term "pentagonal symmetry."

The fissures and elevations produced by the contraction in cooling, of the earth's surface, exhibit this symmetry, according to the theory, throughout; showing an analogy to the symmetrical division of the basaltic rocks which take in cooling the form of regular prisms. If now a map be constructed in which the surface of the earth-sphere is projected upon a tangent plane, the lines bounding the spherical triangles, that is, the great circles which these elevations and fissures follow,—since these circles describe the shortest distances between given points,—become straight lines, and may be easily studied. M. Thoulet says:

"If upon a map of this kind the lines of the pentagonal network are drawn, it is astonishing to see the order which, from apparent confusion, the features of the terrestrial surface assume. The orographic directions arrange themselves just as in the hydrographic system, a direct consequence of the mountain elevations constituting the basins. The fissures of the terrestrial crust coinciding with right-lines, the same should be evident of metalliferous veins, which are only the filling up of these fissures. Water courses are the consequence of elevations; they produced the alluvial deposits, hence these deposits are also strongly constrained to depend upon the pentagonal symmetry. * *

M. de Chancourtois has applied the pentagonal network to the coördination of the sources of petroleum and bituminous deposits; M. Rivat to the lead mines of Vialas and Villefort, France; M. Maissenat to the mineral deposits of lead in the carboniferous limestone of Flintshire, and to the metalliferous deposits of Cornwall and Devonshire, England. Everywhere experience is found to agree with the theory.

The problem proceeds from the known to the unknown, and is as follows: given a series of points where a mineral is exploited in a country, to find the direction of the richest veins, in what direction new mines can be found, and the points where these mines ought to be most profitable. We arrive at a solution by means of what has been called the *useful angle;* this angle once known, the engineer can direct his galleries boldly, for he is certain that in every other direction his researches can have only negative results."

New Anæsthetics.—Dr. Rabuteau (*Gazette Hebdomadaire*) describes three new anæsthetics with which he has made numerous experiments, viz: Bromoform, bromal, and iodal. Bromoform resembles chloroform, but appears to possess some advantages over it in producing complete anæsthesia without causing profound sleep. Bromal differs from chloral in the substitution of bromine for chlorine. Its action on animals is similar to that of chloral. Iodal is also a powerful anæsthetic, but in moderate quantities it causes convulsions and death, producing congestion of the brain and spinal cord.

"The Sour Lake" in Texas.

The *Journal of Applied Chemistry* for March has a communication from "R," who, while engaged in a geological survey of Texas, visited the Sour Lake in the south-eastern part of that State. We quote from the description: "The lake occupies an area of about five acres, but at one time it must have been spread over a larger space. It is of an irregularly elliptical form, surrounded by low, neatly rounded mounds. The water is quite sour, and to most persons has a disagreeable, fetid odor and taste, from the presence of petroleum or mineral oil, which rises from different parts of the lake in the form of small globules, and floats upon the surface of the water. * * Bubbles of carburetted hydrogen constantly escape from every part of the surface of the lake. * * The geological structure of the region consists of alternating beds of light brown and ash colored clay and marl, soft calcareous, and silicious sandstones, and bituminous slabs, with included beds of lignites and iron pyrites. These belong to the miocene tertiary period, which forms a broad belt from fifty to eighty miles wide, and margins the gulf coast for some hundred miles. It is the southern equivalent of the miocene of the *mauvaises terres* of Nebraska, so celebrated for extinct animals, which have been found in such profusion. * * The acidulous waters are derived from decomposition of underlying aluminous and pyritiferous shales, by which sulphuric acid is set free, and becomes mingled with the water which percolates the strata. The astringent taste of some of the springs is due to alum. The source of the petroleum may be found in the decomposition of lignite beds and bituminous shales, which are largely developed over the miocene region of Texas."

Filtering Miasm.—The remarks made by Prof. Tyndall in a recent lecture in reference to the disease so often inhaled in the form of organic matter floating in the air, and to the filtering of the said air by means of a respirator of cotton wool, thus rendering it powerless for evil, have brought out a communication from Horace Waller, F. R. G. S. He writes *Nature* that he has often, while traveling in Africa, slept in the midst of miasm in canoes moored upon those deadly rivers, without ill consequences, simply because the mosquito curtain, which he used, served the same purpose as a filter, that the cotton wool respirator served. The folding and unfolding the curtain soon makes it fuzzy, and it then becomes an exceeding fine strainer—especially when covered with dew—through which all the air breathed by the individual underneath must pass.

Metallic Spectra.—M. Robert Thalén has communicated to the Royal Society of Upsala, a memoir on the characteristic metallic lines of the spectrum, especially with reference to their wave-lengths. As ordinary spectroscopes do not give entirely accordant readings, varying as they do with temperature and other incidental circumstances, it is necessary in all cases to make the solar spectrum the basis of reference. Augström's "normal solar spectrum" was, accordingly, the normal starting-point of the author's researches; and, with this as his guide, he has succeeded in constructing a chart, which gives, in millimeters, the wave-lengths of metallic lines within about 0·0000001 of their true value. Forty-five metals have been thus investigated, and their spectra mapped. Of these, the following give lines coinciding with those in the solar spectrum: Sodium, calcium, magnesium, iron, manganese, chromium, nickel, cobalt, and titanium. The discovery of the last-named coincidence is due to M. Thalén himself.

Zinc Light.—By digesting metallic zinc in iodide of ethyl, we obtain a volatile liquid which takes fire spontaneously in the air, and is known under the name of "zinc ethyl." It can be distilled in an atmosphere of hydrogen, and if this gas be made to pass through the liquid it will carry off some of the zinc-ethyl, and when ignited will burn with a magnificent white flame. It is probable that ordinary illuminating gas would answer as well as hydrogen for this experiment. The light produced in this way can be employed to take photographs, but its actinic properties are not equal to the effects produced by burning magnesium.—*Scientific American.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Better.—*Miner*, March 12th: While the sale of the Buckeye mine to the Exchequer Co. was being made in London, no ore was obtained which assayed over $500 per ton. We hear of several assays of late which go over $1,500. The Exchequer Co. has this week sent out three tons assaying from $100 to $1,200 to be worked at Reno by the Stedefeldt. Several other lots await the result.

Items.—An offer has been made by Pennsylvania Co. to furnish the Silver creek mill with 200 tons of ore on liberal terms, and if samples to be assayed justify the starting up of the mill the offer will be accepted....Fine progress is being made in the Silver Glance and the M. C. Tunnel No. 3.....More water and hard rock have retarded the Globe.

The Mountain.—*Chronicle*, 12th: On the 1st of March the Mountain No. 1 tunnel was in 1,821 feet. During February twenty-six feet were run.

Quartz Mill Sold.—The Pioneer quartz mill, at Markleeville, has been sold to Edward Barnes, Supt. of the Billy Rogers mine in Hope Valley, and F. D. Cottle, of San Francisco.

AMADOR COUNTY.

Rich Strike.—*Ledger*, March 19th: We learn that a rich strike has been made in the Oneida mine. The vein is a little over three feet wide, and so rich is the rock that it is put in sacks in the shaft and then hoisted out and taken to the mill.

Aqueduct City.—Cor. of same: Walton & Co., in the mouth of "School House gulch," having a good claim, but have been trying to make water run up hill. In "Hawkeye," Loring & Co., have struck a side channel, which prospects well. The Brown Bros., above town, are making it pay as usual, but their claim is like Walton & Co's, nearly a dead level. The Ham boys have just commenced piping in "Blacksmith gulch." But the crack claim of this section now is Rendall's, one mile north of Aqueduct. This claim has been abandoned for three years, when Mr. Rendall started in with a hydraulic. It is now twenty feet deep by one hundred in width, and paying handsomely, with the prospect for lasting for two years to come.

CALAVERAS COUNTY.

Mining Items.—*Chronicle*, 19th. Work has been resumed on the old Incline gravel claim, on Chili gulch, near the Junction. In former years this was considered the most valuable claim of the district, but owing to expensive machinery, disagreement of shareholders and general mismanagement, work was suspended. The claim formerly owned by Charles Harken, but at present by Mr. Conly, is paying well, the gravel being worth three dollars to the car lode. Adjoining, on the north, is that of Pallaton, Squires & Co., who, after two years of expensive prospecting, have struck the lead, which prospects big. On the south is the ground owned by Mullen, Ryan & Co., who are opening a bed-rock tunnel; they are in seven hundred feet, with good indications. The other claims on Chili gulch are doing a paying business. Brackett & Co. keep their mill running. Shaw, so long as he runs his hydraulic, never has occasion to complain of hard times. On Sport Hill gulch there are several claims nearly ready to make their summer run.

EL DORADO COUNTY.

Missouri Flat.—Placerville *Democrat*, 19th: A gentleman informs us that miners in that locality are doing remarkably well.

LOS ANGELES COUNTY.

Soledad.—A Los Angeles telegram of 19th says: The Eureka mill continues to send in gold bullion by thousands. The last clean-up of 22 days gave $3,300.

MARIPOSA COUNTY.

Mt. Buckingham Mine.—*Gazette*, 18th: Some San Francisco parties have had several miners at work over a month getting out rock, and now await teams to haul the rock to the mill. We are informed that the vein looks fine. The parties are prospecting it with the intention of purchasing the property.

An exchange says the net earnings of the Fremont estate last month were $16,050. There are now 90 stamps at work on the estate, and the managers are putting up 60 more at the Ophir mills to run by water. The gross yield per day is nearly $1,000, and the cost of reduction is reported at $1 per ton.

NEVADA COUNTY.

Eureka. — Grass Valley *Union*, 16th: We yesterday paid a visit to the Eureka mine. It was melting day and we arrived just in time to see three fine gold bricks turned out. These bricks weighed $26,861.12, and the gold came from twelve days' run of the mill, not counting sulphurets. For the last two months the sulphuret works of the Eureka have been treating the sulphurets of other mines, and the consequence is that there are between thirty and forty tons now on hand.

Specimen.—Yesterday Mr. A. M. Buckham brought to this place a specimen of gold worth $429, taken out of a ledge near the mouth of Wolf creek.

Bowery.—Same of 17th: Yesterday the machinery for the hoisting works went through town, from Gold Tunnel. About the last of April the Bowery will start up. The quartz from the ledge has averaged something over $80 per ton from the day it was first discovered.

Webster & Co.—18th: This company has taken out "fifty ounces of gold dust from a hole not quite large enough to swing a dog in," as our informant expressed it.

Golden Gate.—20th: The machinery of the mill at Rattlesnake, four miles east of Grass Valley, was put in motion, for the first time, on Friday. Everything worked well, and on Saturday the mill did some work on quartz. After Monday it will be kept running day and night on rock from Eddy & Co's. mine, called the Golden Gate. The rock is looking well, and the ledge, of the average thickness of two feet, will pay all the way from $20 to $60 per ton.

Omega.—*Transcript*, 16th: The mining prospect is more promising than for many years. The operations are more extensive, and it is estimated that there has already been as much gravel washed off as in any entire season before. The opinion is that there is now abundance of water to continue washing without interruption till August.

Montana Ledge.—17th: Some excellent rock is now being taken from this ledge, in Willow Valley, which will be crushed at the Oriental mill, idle for some time. The rock, it is estimated, will pay $25 per ton.

Kansas.—18th: It is determined to move the works further down the hill, (Selby) and sink a new shaft. The company feel certain that the gravel channel is to be found, and they mean to find it.

New Hoisting Works.—An engine, formerly used on the White Oak, has been set up on Stiles' quartz ledge, on Deer creek, for the purpose of prospecting.

Burrington Hill.—*Gazette*, 21st: One of the workmen in the claims of the Nevada Consolidated informed us that a partial clean-up was made on Friday, and for the time they had been running, the yield was the best yet. They have now got fairly into the lead, and have a bank of gravel between thirty and forty feet in hight.

PLACER COUNTY.

Rich Strike.—*Herald*, 19th: It is reported that very rich quartz has been struck at what is known as Fiddlers' Green, on the headwaters of Rock creek, a few miles from town. Our informant says that rock of immense richness is being taken out. We have been unable to gather further particulars.

Good Friday.—The Grass Valley *Union*, of 20th, says that on Thursday $1,000 was taken out.

St. Patrick.—The company have a wheel run by water, and are hoisting out quartz. An offer of $100 per ton for the rock now coming out has been made.

PLUMAS COUNTY.

Sawpit Flat.—Quincy *National*, 12th: The miners are busily engaged, and their dump-houses are being rapidly filled with pay-dirt. No washing has been done yet.

La Porte.—Gowell & Conly and Orr & Co. have been piping for several weeks. The present will be the best water season for years.

Indian Creek.—The Dick White claims are still panning out. Bob McGill has struck good pay in the bar opposite the White claims, and a number of other claims are being prospected.

Items.—The miners in Indian and Round Valleys are short of hands. Here is a chance for idle men....Ballou & Emmons are making preparations to work a set of river claims in the North Fork, at the mouth of Butte creek....The New York mill, near Greenville, recently purchased by T. F. Emmons, is crushing rock from the Tinker ledge, and is paying well.... Several men are at work in the Lebanon mine (Blood's) at Genesee Valley.

SAN BERNARDINO COUNTY.

A Los Angeles telegram, of 21st, says that rich tin ore is reported discovered near San Bernardino.

SAN DIEGO COUNTY.

The New Mines.—Los Angeles dates to 17th say: The rush from all points is now about seventy-five daily arriving, very few returning. The following ledges show good rock: The Washington, San Diego, Hoydon, Kate and Kelly. Gold can be seen in the quartz, from the croppings down. It is free from sulphurets or base metal, all in talcose slate. The ledges run southeast and northwest. They are, at the surface, from ten inches to two feet wide. The shafts show wider leads below ground. Owners, for the most part, are unable to work their claims extensively; they have not even sufficient tools. The *placeres* yield very fine gold, and some small nuggets have been taken out. It is not thought the mines will give steady, or more than paying wages, for extended work with rockers will be short.

SHASTA COUNTY.

Slate Creek.—*Courier*, 12th: W. H. Gooch brought down $300 worth of gold dust on Tuesday, and reports the miners doing well.

SIERRA COUNTY.

Mining.—*Messenger*, March 19th: The miners hereabout are putting in big licks now, as the late snows and rains have given them a power of water.

Items.—Workmen are taking out rich looking rock from Ned Leonard's claim for another run....The mining claims on the ridges are all idle, for want of water, which is frozen up....S. D. Hill has commenced hydraulicing on his claim on Badger Hill. ....The tunnel claim on Durgan Flat, now called the White Pine claim, owned by Hill, Allen and Larrieu, is said to be paying well. The tunnel is run under Piety Hill. ....The Monte Cristo company, of Port Wine, are running a new tunnel into their works.

TRINITY COUNTY.

Hayfork.—*Journal*, 19th: Thursday and Friday of last week the Duncan boys picked up $196 in their claim. Hilliard & Hill are said to have still better diggings.

Dutton's Creek.—Accounts continue to be encouraging. The Creek Co. are getting better prospects than ever.

Pony Creek.—New River cor. of same: John Keach, a short time ago, while sluicing in his claim, picked up a 17-ounce lump. Pony creek is 25 miles above here. The Skookum Chemuck boys have a good claim. They came here last fall, and were engaged from the first of October to the middle of February in getting water upon one of the high bars. From their first run—10 days—they cleaned up $138, where they could only set two lengths of flume, and did not uncover more than 10 feet square of bed-rock.

YUBA COUNTY.

Smartsville.—Crary, O'Brien & Co., in their hydraulic claims, cleaned up, after a run of thirty days, $70,000. These are new claims, this being the third run, and the yield has been about the same.

Arizona.

Big Bug.—Prescott *Miner*, March 5th: The mill of this company, of 10 stamps, has ground out an immense amount of gold in the past two months. The latest run paid better than any. The stamps were run 10 days, and the amount of gold saved was about eight pounds, worth $1.700. The mine is looking finely. The Supt. thinks there is sufficient ore in sight to keep the mill crushing for two years. We understand the owners intend to erect more stamps soon.

The owners of the Independence lode will sink 50 feet, and have the ore crushed at the Big Bug mill.

Walker District.—Col. Jackson and others are going to start the Eureka mill. Messrs. Hargrave and others returned Thursday. From them we learn that Taylor & Co., of Hassayampa, have considerable rich rock on hand. They found Uncle Billy Pointer's arastra, in Walker, crushing ore.

Placer Mining.—At Black cañon, Bradshaw district, 15 or 20 miners are making fair wages washing the gravel of the high bars adjacent to the bed of the stream. Higher up Black Cañon creek, in Pine Grove district, there are 20 men engaged in quartz and placer mining. At latest dates they had erected two arastras. On Upper Lynx creek but little will be done until the snow on the divide melts. Of course, parties are taking out ore, and placer mining with rockers. By the latter considerable gold has been extracted. Lower down the creek there is more water, and the miners are doing well. A great deal of coarse gold has recently been mined out of England gulch, but water is scarce now, and some of the miners have left for the Hassayampa, where men are making from $3 to $10 per day. Lower down at Walnut Grove, placer mining is carried on profitably.

Colorado.

Mining Items.—Central City *Register*, March 10th: The Unexpected lode has recently opened out again, and is producing ore which yields six ounces of gold per cord. They have also struck good ore in the Justice lode.....The average assay of all the ores from various mines worked by the Franklin company's mill in Gilson Gulch, is $135 per ton in silver. ....J. F. Topping has commenced operations on the Seaton lode, having got up a whim and begun to take out the water.... From Gregory Point down the gulch and along the line of North Clear creek, above Black Hawk, sixteen quartz mills are in active operation. Prof. Hill's works are in full blast, with a fair supply of ore on hand for reduction.

From same of 17th: Miley has struck it big in the Bates Tunnel. He is working three drills and taking out 1½ cords per day. The crevice is four feet wide, with 12 to 15 inches of rich copper ore....One panful of dirt was washed down to two pennyweights of gold, in Charley Walker's bar diggings, Black Hawk...Very rich ore has been struck in the Consolidated Gregory mine, where the Foote & Simmons crosses it....Powell and Applebury are taking out ore, which runs from six to eight ounces of gold bullion per cord....Jo. Goodspeed is fitting up the Rocky Mountain mill....Cy. Hurd has struck rich ore in the American Flag...A new mine in Lake Gulch, worked under lease by two Englishmen, is reported to be producing ore which yields forty ounces of gold bullion per ton ...Sam. Story, Mr. Smalley, John Gray and others, at work on the Gunnel lode, under lease, at depths varying from 80 to 150 feet, are all taking out good ore.

The Marshall.—Georgetown *Miner*, 10th: This tunnel has struck the casings of a new lode, within a distance of less than seven hundred feet. It is probably the casings of the Compass and Square. By recent surveys it has been ascertained that the rich silver veins known as the Panama, the Indigo and the Tom Thumb will be cut by this tunnel, within a distance less than two hundred feet above the Compass and Square, and that the great mammoth Argentine will be reached within two hundred and eighty feet. The tunnel will cut all the lodes before the expiration of the present year.

Idaho.

The New Mines.—*Statesman*, March 10th: Men on Snake river are making from $5 to $10 per day with rockers * * We have good mines within 15 miles of Boise City. The new ditch of Sterling & Co., on Willow creek, is running 800 inches of water, which will be soon used on the newly discovered placer mines. Barrett, Williams & Co. made a clean-up after a week's run, of 40 ounces.

Idaho City.—Cor. of same; The indications are good for the mining season. Miners will be in demand.

From the Payette.—Eagle Ranch correspondence of same: I hear of several mining companies in full blast near here. The following are among the more prominent: Warriner & Keefer, Wakefield and Allfore, Wells & Warwick. Martin, Moore and Chandler own rich and extensive diggings three miles from the north fork of the Payette, to the northward.

Snake River.—*Avalanche*, 12th: Messrs. Paine and Murray started for the Snake river diggings on Tuesday. Col. Kirkpetrick and party returned last night. They found only seven men rocking above Clark's ferry, who reported they were making eight dollars per day to the rocker. It was in a small eddy, which they would work out in eight days. That is the full extent of the diggings.

Items.—Smythe & Clark have sold one-half of their placer claims at the Wagontown diggings for $900. Chinamen were the purchasers....The Owyhee mill has shut down for two weeks....Work has been suspended on the Red Mountain mine for the present....Shuster & Co. will commence mining in Blue gulch next week.... The miners of Jacob's gulch are jubilant over their prospects for the coming season. ....Mr. Peck is still prosecuting work on the Potosi, which looks better every day. The lower tunnel is in 165 feet, 90 feet beyond the main shaft. A shaft is also down 75 feet below the level of the lower drift.

Loon Creek.—*World*, March 3d: There are now at the camp about 250 men, nearly all of whom are working and prospecting. In Stanley's basin nine men are wintering. Shallow diggings pay well there. On Robeson's bar, Salmon river, 20 miles below, are drift diggings which pay well. They are on a direct trail from Idaho City to Salmon City. These diggings paid $5,000 last fall.

Montana.

Philipsburg.—*New North-West*, March 4th: Merrill & Ullery have struck rich ore and commenced taking out for test. The want of proper roads has been the cause of the mill stopping thus long. A few days will enable the force now engaged to furnish plenty of ore.

"O. J." writes the *Gazette*, that the workmen in the old Camanche No. 2 have struck the ledge in their cut, and will soon be able to keep the mill supplied. Two tests in the mill have been made of rock from the Speckled Trout lode. The rock was selected by two parties as average ore, and worked separately. One went $53, the other over $70.

Cedar Creek.—T. R. Dana reports the discovery of two new gulches—California and Snow Shoe—and the organization of a district immediately above Barrett's, discovered by Dan. Brown and Nat. Heel. California gulch is said to prospect from two to five bits to the pan. The bars on Cedar are the absorbing excitement now. Several rights for conveying water to them have been recorded at Missoula. Very few persons are now going into the mines, and still less coming out. A number have their draining and sluices ready to run when the spring opens.

The Prospects.—Deer Lodge *Independent*, March 5th: Every week we become more and more assured of an unusually prosperous mining season. The snow on the mountains is deeper than for many years. At Butte City, not less than 1,000 men will be employed. Boker City will be a flourishing camp. Silver Bow will certainly be lively, as most of the water is obtained from Divide creek.

Items.—*Herald:* A. Murray is taking out silver rock from the Blue Wing. The ore will be smelted in the Deriar furnace. Mr. Stapleton is to start up the Tootle & Leach furnace. Other parties at Argenta are taking out large quantities of ore. It is now proven that the immense bars below Argenta, and all the gulches north of Rettlesnake, will pay excellent wages for sluicing, and by spring a ditch will be completed.

Bannack.—"S. F. D." writes that the bullion yield of Beaverhead county in 1869 was not less than $400,000. There are now more men drifting in the bars and in the shafts in the bed of the creek than last winter, and the weather has been so mild that thousands of dollars have been taken out with the rocker.

The *Gazette* says the base metal lodes of Philipsburg are showing such quantities of galena as to induce the erection of a couple of smelting furnaces. The Cole-Saunders Co. will get their furnace running in 60 days. With the present mill and two furnaces running we will, the coming season, ship more silver than any other camp in America, in proportion to the amount of machinery in use.

Adobe Town.—Virginia *Times*, 7th: Quite a number of companies are drifting and taking out pay. We believe that the miners have not lost a day the present winter. The same may be said of the miners at Junction, who are all piling up dirt for spring washing.

Items.—Several men have been mining in Remshorn gulch most of the winter. The miners are sanguine of good diggings the coming season....The Granite creek 10-stamp quartz mill started up yesterday. ....John Rook & Co. have sold 200 feet of mining ground in Alder gulch, below Junction, for $1,000....From Alder the yield will be large. Preparations are made for an early start.

Nevada.

WHITE PINE.

The severe weather has been unfavorable for mining. Surface work is almost stopped, and several of the mills and furnaces are idle for want of ore. The Mammoth has struck a fine body of ore on the 30-foot level. The *News* says that the five mines which the new English company proposes to buy are the Aurora South, Eberhardt, Evening Star Consolidated, California and Aurora Consolidated. The company intends contracting for workmen in England; wages to be agreed upon there, the contract to be in writing and a portion of the sum to be paid in advance to the families of such as prefer to leave them in the Old Country.

Items.—*Empire*, 16th: The Milton mine, southwest of Shermantown, was sold on the 13th to the Metropolitan Co. for $11,200. We understand that work will commence immediately. 17th: The Alsop Smelting Furnace is still in full blast. This furnace commenced the run on the 28th of February, and now the company have 100 tons of bullion piled up around the works. As the supply of coal and ore is abundant, and a constant supply coming in, it is hard to tell when they will let up. We doubt not that within the next six months all the refractory ores of the district will be worked at a cost even less than milling ores can be.

Ely District.—Cor. of *Empire:* The Pioche ledge is the biggest thing I have seen in the State, outside of the Comstock. It varies in width from eight to fourteen feet. Shafts have been sunk from 40 to 90 feet in depth at short intervals for a distance of 2,000 feet. To a depth of 40 feet the bulk of the ore is argentiferous galena, carrying a fair per cent. of gold. At this depth the character suddenly changes, the base metals giving place to free milling ore of extraordinary grade, ranging in value per ton from $150 to $1,000. The ledge is believed to be continuous for several miles. The company claims over 60,000 feet in the district, has an arsenal upon the ledge, and is said to be opposed to a heavy immigration to the district. It has, however, done more than all others towards developing its resources. The only mill in this section is that belonging to Ely & Raymond, in Meadow Valley, carrying five stamps. It is being run on ore from the Burke mine, and turns out an average of $850 per diem.

Prospectors are active, and new strikes are of almost daily occurrence.

Pat Burke recently disposed of a fourth interest in the Burke mine to John Ely for $16,000 in silver bars. Pat left Hamilton in August last with his blankets on his back.

The *News* has been shown assays from Ely ledges outside of the Pioche. Two were from the American Flag ledge, owned by W. A. Johnson, 2,000 feet southeast of the Pioche; the first shows $245.04 and the second $276.45 to the ton. An assay from the croppings of a ledge some distance north shows $76.96.

Sierra and Secret Valley District.—Cor. of *Empire:* McCann & Co. have a ledge one-half mile north of Bromide Hill, which is fully 40 feet wide, with ore uniform throughout, and assaying $125 per ton in silver, besides containing lead enough to make it good smelting ore. Wood is abundant, and water can be had within half a mile.

Silver Park.—*News:* Ferguson's mill will be ready to start next week, and Wilson's 10-stamp mill in about four weeks. The mines are looking well. The Silver Star is worked by a large force of men, and the ore is of high grade. The shaft of the Magnolia is down 35 feet, where a drift has been commenced along a vein of high grade ore six feet wide. The Nevada Queen is turning out large quantities of good ore. The Glen Dor has a six-foot vein of rich ore.

Rich Strike.—On March 7th a teamster named Bradshaw, in searching for cattle on a mountain a few miles southeast of Silver Park, stumbled upon a large ledge literally filled with horn silver—the lowest assay of the ore going $1,400. Late accounts say that Bradshaw and Conway have out several tons of ore, which will work into the thousands.

Kern District.—*News*: The Fitzhugh mine has a shaft down 40 feet, with a large ledge of high-grade ore. The Silver Peak and Mountain Brow each have a 6-foot ledge. The Mother Ledge, six miles east, varies in width of croppings from 12 to 25 feet, and assays run from $60 to $230—the average being above $100. There is a good road from Kern to Toano, 100 miles.

New Mexico.

Ute Creek.—*Press and Telegraph*, March 2d: The Montezuma mill is completed, and all the stamps in running order, though the supply of quartz only employs 15. The Aztec mill is paying largely; the quartz is excellent, and so abundant that the day shift only is worked in the mine, they being able to keep the 15 stamps fully supplied. Wiggins & Co. are opening a new lode—discovered last summer—about 100 yards from the Aztec shaft. They have a large body of quartz, and have had about one cord of it worked in the Aztec mill, and the yield was over $400.

A Singular Phenomenon is *reported* as having occurred in the harbor of St. Johns, N. B., on the 18th ult. A loud rumbling noise was heard, and immediately after a portion of the bottom of the harbor, on the Carleton side, sank bodily, so that where before there was beach at low tide, there is now twenty feet of water. Several wharves were destroyed and some lumber set adrift by the occurrence.

San Francisco Mining Stock Market.

MINING SHARE MARKET.

Business continues quite active at the Board, the aggregate sales being fully as large as during the previous week, prices of most descriptions showing an advance, and, upon the whole, the speculative disposition so recently inaugurated exhibits no abatement. Work continues to be vigorously prosecuted by the various claims upon the Comstock lode, and, in the majority of cases, with more hopeful results than for a long time past. The lowest working depths certainly give better promise of a continuation of the ore bodies, and it is to be hoped that the energies of so many interested parties will be most amply rewarded.

Gould & Curry—has been the most important stock upon the market, about the same amount changing hands in the open market as during the previous week, but at greatly enhanced rates, as will be seen by reference to the recorded sales. During the week ending March 21st, 540 tons of ore were extracted; previous week, 518½ tons. Last Chance stope has produced over the average quantity of better ore, and the United States section is affording an increased amount, the faces looking as promising to-day as they did a week ago. It will require some days yet to place the Potosi chimney in proper shape so as to enable them to extract the ore in a cheaper way. They have been steadily at work extracting ore from the El Dorado section, and have raised upon the deposit some twenty feet since the last report, the ore continuing as good as previously reported, with fair prospects that the quantity will soon be increased. They are carrying the stope forward some 56 feet in width, and at right angles with the deposit. The northwest drift, on the seventh station, is 270 feet north of the shaft, and during the week under review they passed through some flinty quartz, expecting a favorable development before long. The north drift carries clay and porphyry. A special meeting of the stockholders will be held on the 25th of April, at the office of the company, for the purpose of taking into consideration the proposition of increasing the capital stock from $2,400,000, divided into 4,800 shares, of $500 each, to $3,600,000, divided into 24,000 shares, of $150 each.

Hale & Norcross—sold to a considerable extent, at very uniform rates. For the week ending March 19th the upper mine yielded 348 tons of ore, and the lower 856½, making a total of 1,204½ tons; previous week, 1,073½ tons. Remaining on the dumps, 8,703½ tons, of which 2,485 tons is low grade. On the 22d inst. the shaft was timbered to a distance of 60 feet below the sixth level. They continue in the ore of the vein, although they expect to cut the west wall on the west side of the shaft. The north half of the shaft is said to be in very choice ore, and the south half is now interrupted by blocks of porphyry. The south breast on the sill floor of the sixth level is now 70 feet south of the shaft, the ore showing a width of six feet, and in good quality. The bullion returns for the month of February aggregate $145,203.

Chollar-Potosi—has been in larger request than during the previous week, showing a slight improvement in price. During the week ending March 18th 1,150 tons of ore were extracted, showing an average assay value of $46 58 per ton; during the previous week 1,234 tons were mined. At the first station of the new shaft 58 feet have been added during the week, making the total distance from the shaft 365 feet, and at present the material is favorable for rapid drifting. No falling off of ore is noticeable in the old ore producing localities. From the daily ore slip of the 21st inst. we learn that 211 tons of ore were forwarded, for reduction, to four different mills. ——Kentuck has been less active than last week, and sold at a recession. Nothing favorable has been discovered.

Overman—has been in good request, and has been well maintained. For the week closing the 20th inst., 1,018 tons of ore were extracted. The drift running south on the 226 level, is reported to have developed some good ore, being the same body that exists 200 feet farther south from the present working locality, and 120 feet below the Lambert Tunnel level.

Crown Point—is in rather large request at an improved price from opening rates of the present week. For the week ending March 18th, 410 tons of ore were extracted, showing a 65 per cent. assay value of $10,126. The ore is taken from the 300 and 400 levels. They continue to prospect for the top bodies of ore.——Imperial rules very much higher than last week. They have been vigorously at work in the lower drifts, and soon expect to make important connections.——Sierra Nevada reports a yield of 390 tons of ore from the gravel deposits for the week ending March 21st.——Lady Bryan levied an assessment of $2 per share on the 17th inst.——Justice levied an assessment of $12 per share on the 21st.——Amador (Cal.) shows a bullion yield at $58,692 for the month of February.—*Commercial Herald*.

New Incorporations.

The following have filed certificates of incorporation with the County Clerk, San Francisco:

Fifth Baptist Church.—March 18th. Trustees: Robert Taylor, Josiah O. Trask, Philip D. Dode, Stanford Hilton, and James Heron.

California Dairy and Farming Co.—March 24th. Object: To establish and carry on the business of a diary; to carry on farming in all of its branches. Capital stock, $30,000; term of existence, fifty years. Trustees: Spencer Poole, Henry Dyer and John A. Moore.

The following have been recorded in the Secretary of State's office, Sacramento:

Schuykill M. Co.—March 16th. Capital, $50,000; divided into 2,500 shares. Place of business, Grass Valley. Trustees: Wm. Sleep, Wm. E. Reed, Henry Rowe, Wm. Keniss and C. Trimbly.

City Creek Turnpike Road Co.—March 22d. Object: To construct a road in San Bernardino county. Capital stock, $6,000. Directors: E. Daly, Jos. Thorn, W. La Praix, W. Caloy and Jas. W. Waters.

Southern Pacific Railroad Co.—March 23d. The company contemplates the construction of a railroad from San Francisco to San Diego, running through the counties of San Mateo, Santa Clara, Santa Cruz, Monterey, San Luis Obispo, Santa Barbara, Los Angeles and San Diego, with such branch roads through Los Angeles, San Bernardino and San Diego as are advisable to connect with the Southern Pacific Railroad at a point near the Colorado river. Length of road, six hundred and twenty miles, including branches. Capital stock, twenty million, divided into 200,000 shares of $100 each. Directors: John Forster, W. J. O'Connor, Wm. H. Harp, A. F. Hinchman, J. B. Shaw, W. S. Rosecrans, L. O. Gunn, C. B. Polhemus, Ben. Dreyfres, Edward J. Pringle and Edward Martin.

Meetings, Elections, Etc.

San Marcial M. Co.—March 16th. Trustees: H. Brickwedel, J. Branham and G. F. Bragg.

San Francisco & Oakland Railroad Co.—March 21st: Directors: Alfred A. Cohen, F. D. Atherton, D. P. Barstow, D. O. Mills and W. C. Ralston.

Knox M. Co.—March 22d. Trustees: Jas. T. Boyd, R. F. Morrison, J. G. McCullough, T. A. O'Brien and S. P. Howes.

* * *

Over the action of the Legislature in passing the bill for the continuance of the geological survey we have rejoiced greatly, and all the more that it militates against the assertions made elsewhere, that it could not succeed on account of the "ignorance and stupidity of Californians," as one Eastern paper hath it. We only hope now that Prof. Whitney may be able to get without delay the money voted him, as he himself is already prepared for the work.

* * *

From Mexico come statements of new gold discoveries. According to reports from Chihuahua, rich diggings have been found in the district of Hidalgo. Rich placers have been discovered near Acapulco, and new petroleum wells have been sunk at Tihuatlan in the district of Tuxpain.

* * *

We have received several chromos from Mr. J. Hoover, publisher of chromos and lithographs in Philadelphia, which are exquisite productions of art. A picture of American and one of foreign fruits, and one or two domestic scenes, among others, are most charming.

* * *

In exploring the caves at Wellington, N. S. W., the remains of various extinct animals have been discovered.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Large vs. Small Threshing Machines.

Mr. William Pfeiffer, a subscriber in Santa Clara, who writes us with regard to large *vs.* small threshing machines, thinks we did not speak sufficiently strong in regard to the greater economy of the latter in our recent reference to the subject. Mr. P. very properly says that the small machine will greatly aid the introduction of diversified farming into this State. Where large machines, only, are employed, the farmer, if he cultivates only a moderately large tract of land, must put nearly or quite the whole in wheat, in order to secure a crop sufficiently large to make it an object to bring the thresher to his place; and even then he has to pay an extravagant price for the work, which is, moreover, done in a wasteful manner.

By the use of a small thresher, the farmer, who usually has a plenty of time, can do the work of threshing, himself, employing only his own animals and regular farm hands. Several neighboring farmers might club together and own a machine in common. By this arrangement the farmer need put in only just the amount of wheat which best suits his land and circumstances, devoting the balance of his crop to other purposes—as grass for stock, roots for swine, flax-seed and castor beans for the oil mills, and flax fiber sufficient to give in exchange at the Oakland mill for his grain sacks. He can raise his own pork, beef, chickens and fruit, make his own butter and cheese, raise beets or sorghum enough to buy or make his sugar and syrup,—plant a few mulberry trees or poppies to give employment to such of his children as cannot be employed in ordinary farm labor; in short, raise almost everything he needs in his family, and put the greater part of the money he receives for his wheat into the savings bank to accumulate for future needs. It is this kind of cultivation that will fill up our State with thrifty and industrious farmers.

Our correspondent asks: "Mr. Scoville, of Oakland, has given the hill farmer a good side-hill plow; who will give our small farmers a good threshing machine?"

In reply to this query, we would say that a small and differently planned harvester from those now used here, for gathering and threshing grain, is about to be introduced from one of the British Colonies, where it is said to have proved very serviceable. This machine has recently attracted the attention of one of our own citizens, who has already ordered a sample machine for the purpose of introducing them into California.

Small Fruit in the Rocky Mountains. It is thought that important acquisitions to our small fruits might be realized from cultivating and improving some of the wild berries which are found growing in the Rocky Mountains. There is said to be a raspberry (red) there that does not grow more than a foot high, and is covered with fruit so thickly that you can scarcely see cane or leaves. There are also white raspberries, red and white strawberries, that leave their hulls on the vine, and white, yellow, red and black currants, that are large and fine-looking, excelling in these respects the cherry currant, and bearing heavy crops on bushes from four to eight feet high. They have, however, so thick and acrid a skin in their wild state as to be almost useless. This objection might possibly be, in a great measure, overcome by careful cultivation.

English tea-drinkers are of opinion that tea carried to them by way of San Francisco and New York is less liable to loose its flavor than when shipped by way of Good Hope or the Horn.

Diseases of Horses—Ring-Bone.

The horse is one of the most powerful and ambitious, and at the same time the most delicate and sensitive, of domestic animals. Neither in structure nor nature is he calculated for rough-and-tumble usage. His ambition often leads him to over-exert himself, especially when his over-sensitive nature is unduly or roughly urged.

The humane and intelligent observer cannot fail to be pained at the number of defective horses which are daily met upon the street or road. Some are ailing in the fore limbs, others in the hind ones, or both. These ailments are seldom the result of age, defective blood or special hard work. They are more frequently the result of ignorance or carelessness than of deliberate cruelty—very frequently from thoughtless placing of the animals in situations where over-exertions are made to escape from apprehended danger of whip or club.

A rough man should never be trusted with the care of a horse—especially of a spirited one. The greatest caution cannot prevent accidents from sometimes occurring; but if proper care and intelligence is exercised, we should be less frequently pained with the sight of halting and otherwise defective horses upon our streets and in our fields. Having in previous numbers given some few simple directions for purchasing a horse, and described the appearance of a perfect horse, we propose, from time to time, to describe the principal diseases to which this noble animal is subject, and to add a few hints as to his proper treatment. We commence to-day with the

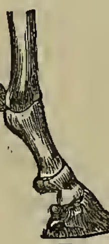

Fig. 1.

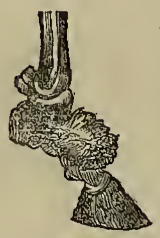

Fig. 2.

Ring-Bone.

This distressing disease is one of those which *may* become hereditary, yet the question of hereditary transmission is a very nice one, and seems to be more prominent in the second than in the first generation. An intelligent gentleman has given as his experience, that but one mare out of twenty-four that had ring-bone produced a colt that had ring-bone; but that the disease appeared in fully three-quarters of the next generation!

This disease is generally caused by heavy draught, especially in up-hill work. It is a disease of the bone proper, and not of the soft tissues, in which it is particularly distinguished from *spavin*, which latter is caused by a slipping, over the bone, of the cartilages or attachments of the muscles to the bone, and a consequent osseous union of the bones of the hock. Ring-bone is generally supposed to be produced by a slipping of the membraneous covering of the bone, whereby an infiltration and a diseased formation of bone is caused, with or without a stiffening of the fetlock and coffin bones and joints.

When once established, ring-bone consists of a bony enlargement, as shown in figure 2, which is contrasted with a healthy bone, as in figure 1. The commencement of the disease is a simple inflammation of the membraneous covering of the bone, which, if not suppressed, is soon communicated to the bone itself, with a final result more or less approaching to that herewith depicted. Sometimes only a very slight osseous formation is produced, the disease remaining stationary for years, without unfitting the animal for light labor.

After the bony enlargement has actually commmenced, there is no absolute cure; although counter-irritants, blisters, etc., may, to a greater or less extent, relieve the pain and lameness, and entirely prevent or greatly retard any further enlargement. The only time when any cure can be effected is, while the inflammation is confined to the membrane, and before the bony enlargement commences.

The first appearance of the disease is indicated by a hard swelling upon the top of the fetlock or pastern joint, accompanied by tenderness, pain, heat, etc. Cooling appliances, such as cold water, soap, camphor, etc., with a little laudanum, should be promptly applied, giving the animal perfect rest, with green food or roots in connection with hay—no grain. This may be followed by some convenient preparation of iodine, like an ointment of an iodide of lead and lard. Rub in the ointment well, and follow up the treatment for several weeks. If the case is an obstinate one, try blistering with cerate of cantharides, continuing, at intervals, the use of the iodine. Equal parts of turpentine and kerosene would, no doubt, form a most excellent wash—the crude coal oil would be better than that which has been refined. Rub it well into the hair around and above the hoof.

Figure No. 2 presents a case of extraordinary severity, in which the enlargement of the bone was so great that it grew from each side quite around, and pretty much entirely covering the healthy bone, which passed through the diseased formation as through a ring.

New Method of Grafting.

Mr. S. Hutchinson, of New Hampshire, is said to have invented a new method of grafting, for which he has received a patent. A well-known device is practiced in making layers, by bending down a limb, covering a portion of the same with earth, and allowing it to remain in that position until rootlets have formed sufficient to support the stem which is allowed to remain above ground. Again: when a branch is situated so high upon a bush or tree that it cannot be brought down to the earth, then the earth is carried up to the branch. Supposing we wish to make a branch of an apple tree produce roots from any particular part, we have only to surround it with soil, moss, or some similar substance, and keep it moist until roots are produced, just the same as though it was near enough the earth to bend it down and cover with soil.

In making layers of some kinds of trees, it is best to scarify or cut through the bark before inclosing with soil. Now Mr. Hutchinson proposes not to wait for the production of roots, but to insert them into the branch, and in doing this the branch is scarified, and if the grafts do not unite, new roots will be very likely to be emitted from the wounds. *Hearth and Home* suggests that the inventor should not confine his experiments to trees like the apple, pear, willow, and other kinds that emit roots very readily from layers, but give the public some examples of grafting upon the hickory, butternut and black-walnut. If it works well on these trees, then we will be ready to say that his new method of grafting is of some value.

Figs in Ohio.—It may not be generally known that figs are raised, in the open air, in the southern part of the State of Ohio. Gen. J. W., of Chillicothe, O., has thus raised them for a number of years, and has published a small pamphlet on the subject, urging the more general cultivation of the fig in that State, which he says is perfectly feasible.

Blooded Fowls.—By the Panama steamer which arrived at this port a few days since, Mr. M. P. Thompson received from New York a fine pair of Brahma Pootra fowls, weighing from eight to ten pounds; also a pair of Hoodan fowls.

Fertilizers vs. Machinery.

John H. Klippart, Secretary of the Ohio State Board of Agriculture, in his annual report for 1868, says that while the previous twelve or fifteen years have witnessed a greater revolution in the introduction of mechanical forces into practical agriculture in that State than the most fertile imagination could have conceived at the commencement of the present century, there has been no material improvement in the management of the soil, for even a greater length of time. The result has been that neither the product per acre nor the aggregate yield of the State has been increased during that period. No crop of wheat since 1850 has equalled the yield per acre of that year; on the contrary the decrease has been regular. So great has been this falling off that the production of wheat in that State, instead of furnishing an export of 10,000,000 bushels, as in former years, now falls short over 3,000,000 bushels of home consumption. The Secretary remarks that Ohio cannot retain her position in the family of the States if she fails to produce a sufficiency of breadstuffs for her own consumption; and suggests that, inasmuch as improvements in machinery seem to be unequal to keep up the average of yield, experiments in the direction of higher cultivation should be instituted to accomplish that end.

What is said of Ohio is, to a great extent, applicable to California, notwithstanding our great surplusage of new land. The time will soon come, if we do not improve our cultivation in the way of soil management, that we, too, shall fail to be a wheat-exporting State. Californians must learn the lesson that it is more remunerative to grow thirty-five to forty bushels to the acre than eighteen or twenty. We must cheapen the production of wheat by higher cultivation, and not depend too much upon a change from old to new districts, or upon improvements in machinery. to keep up our annual yield. No farmer will ever get rich simply by using machinery. Important as machinery is to the farmer, that is not the principal point to be considered in cheapening farm products.

Our great object at the present time should be to get or keep our land in the best condition to raise, not wheat altogether, but large and *varied* crops, and then study to find out how to convert them into wool, cheese, butter, pork, eggs, etc., at the least cost. Our farmers must wake up to the fact that our lands need nourishment—that after a few years' use they require to be fed just as much as our oxen or horses, to yield a fair return. The bad policy of a constant cropping of the soil, year after year, without returning any equivalent, is beginning to be alarmingly manifest in diminished yield and stinted, shriveled grain.

The inquiry sometimes comes up, "What shall we do? Barnyard manures are too scarce and too costly—in fact, can't be had, in any large quantity—moreover the hauling of such bulky manure and spreading it over fields is altogether too expensive at the present rate of wages in California.' True, but we have an abundance of concentrated mineral manures on this coast, which will be provided, in any desirable quantity, so soon as a demand appears for them. Already we have gypsum in abundance. Guano and gypsum, judicially employed, in connection with summer fallowing and turning under green crops, are both cheap and potent, and within the reach of all. We are anxious to hear of the man who has adopted this management with exhausted land, without receiving a handsome gain over the expense. Such a policy is far better than "selling out" and going farther from the market to find new lands. Farmers who pursue that course are like the devouring locusts, that eat up the substance of one locality and hasten on to destroy the next. Better stick to your present localities—plow a little deeper, till thoroughly and dress freely, and your profits will increase vastly, while your farms will rapidly improve in value.

Grafting the Vine.

Many grape vineyards in the State are of little value, by reason of the inferior varieties of fruit produced in them. To remedy this, either some new use must be found for such fruit, or the present vines must be replaced by others, or grafted with superior varieties.

To the expense of removing the old vines and planting new would be added the three or four years ere the new vine would produce in paying quantities. A strong old vineyard, grafted, will average about a ton of good grapes to the acre the first year and a full crop the second. Hence the successful grafting of vineyards must be profitable.

Mr. George G. Briggs, of Oakland—who planted the extensive pioneer and once famous Briggs' Orchard near Marysville, and who is now largely interested in the culture of grapes in this State, and has had ample experience in the culture of the vine—is my main authority for the information now offered. Mr. Briggs believes the grape to be a noble fruit—too good to be the vile servant of dissipation and loathsome ruin, and good enough to serve the better wants of man as refreshing and nutritious food. Designed by a benificent Providence to bless the earth, how often is it corrupted to feed the perverted passions that bewilder the imagination and burn to misery's core the mind and very life of man!

The Best Time to Graft.

Mr. Briggs finds it to be when the vine has fairly commenced to leave out in the spring. The stem bleeds but little at that time, and the granulation goes on rapidly. "The books" differ much as to the time and manner of grape grafting; but the experience of Mr. Briggs agrees with the *rationale* of true theory.

The Scions

Are cut in the fall or early winter, and kept fresh in a dark, cool place, but are not allowed to fill with water before grafting, as that would cause a stagnant inaction and prevent ready connection. When the scion *draws* on the sap of the plant, the circulation induced incites a rapid healing, and success is almost certain.

Mr. Briggs has tried the various ways advised—as split grafting, spile grafting, etc.—but has adopted

A Novel and Superior Way

Of his own. He has had a hook-shaped implement made to order, with a cross-handle, which can be used in one or in both hands. The sharp end of the hook is shaped like a triangular gouge. In using it, the man stands over the stump to be grafted, and cuts into the side of the stock from the bottom up, drawing the hook towards him with a right-and-left movement, which leaves the groove cut a little the widest at the top. The lower end of the scion, which is about a foot long, is then shaved on three sides to fit the groove, and dove-tailed into the stock with a firm, sliding pressure. This is certainly better than the awkward way of splitting the stock, and insures equally as strong and solid work. I have had many years' experience in grafting, and am favorably impressed with Mr. Briggs' method. The same will apply with equal advantage to many of the plants.

In grafting grape vines, Mr. Briggs uses five men to the best advantage. One removes the earth from about the stalk, the second saws the vine off six inches below the surface, two more do the grafting, while the fifth follows with the wax, which is kept melted in a pot by the heat of a lamp. He uses common grafting wax, and applies it with a brush. The earth is then drawn and firmly pressed about the graft, leaving about two buds above the surface. The five men will average about 1,000 grafts per day, or an acre of vineyard.

Best Varieties.

Immediately along the coast where the cool and damp sea breezes prevail, the White Malvoise is an excellent variety, as it is early and less subject to mildew than most other sorts.

The White Muscat of Alexandria is probably the best raisin grape known, and it is also of superior excellence as a table grape.

The Black Hamburg and Black Prince are superior black table grapes. The latter stands transportation well.

Among the rose-colored varieties, the Flame Colored Tokay stands ahead as a market grape.

For high mountain districts, the Concord, Isabella, Ionia, Diana, Delaware, etc., are worthy of trial. S. H. Herring.

Mode of Nourishing the Street Trees in Paris.—All the boulevards of Paris are planted with trees, many of which, however, were destroyed during the Revolution of 1848. New trees were therefore planted, and their growth fostered with an amount of skillful attention, which has produced astonishing results, when the natural disadvantages are taken into consideration. The trees are planted in loam, which has been previously mixed with sand, and transported to the city. This is contained in large receptacles, lined with brick, sunk below the surface of the foot-way and coated over with cement, so as to render them impervious. They form, in fact, gigantic flower-pots; and into them are conducted the roof-drains of each house-block, from which the earth derives its water supply. These basins, or flower-pots, are built of capacity sufficient to admit of considerable expansion on the part of the roots of the trees. An ornamental circular iron grating, set flush with the foot-way, is placed over these basins and around the trunks of the trees. This admits of air for the proper support of the roots. The roots of the trees are thus removed from the deleterious influences of escaping street gas and the poisonous emanations from sewers, causes which are well known to have destroyed the vegetation in the streets of many cities.—*Technologist.*

A New Discovery in Raising Corn.—An intelligent and reliable neighbor of ours, who has for many years been making experiments with corn, has discovered an importance and value in re-planted corn which is quite novel, and worthy of publication. We have always thought that re-planted corn was of very little consequence, but this gentleman says "it is of so much consequence, he re-plants whether it is needed or not—or rather, he plants two or three weeks after the crop is planted, a hill about every fifteenth row each way." He says: "If the weather becomes dry during the filling time, the silk and tassel both become dry and dead. In this condition, if it should become seasonable, the silk revives and renews its growth, but the tassel does not recover. Then, for want of pollen, the new silk is unable to fill the office for which it was designed. The pollen from the re-planted corn is then ready to supply the silk, and the filling is completed." He says nearly all the abortive ears, so common in all corn crops, is caused by want of pollen, and that he has known ears to double their size in the second filling.—*Exchange.*

The Forests of the Sea.—The sea has not only its mountains, its fountains, and streams, its forests with their peculiar plants, their splendor of color, their lovely flower gardens and extended prairies; it has its landscapes, that are more splendid and fairy-like than any that are to be seen on the earth. Let us take the sea fire-garden for example. It grows in such a beautiful form, and its color is so lovely, that those who have seen it growing out under the water say that it surpasses their powers of description.

The fire-gardens at the bottom of the sea stretch over the prairies of the ocean and climb up the mountain sides. They are covered over with the beautiful gold-colored coral moss, and their leaves wave to and fro with the currents. The largest forest in the world is in the Sea of Sargossa, between the Azores and Antilles, and is six times larger than Germany; so that Columbus needed fourteen days to sail over it.

Fruit trees planted on cleared timber land are said to come into bearing sooner than when planted on prairie land; but the latter will continue fruitful much longer. As a general rule, all fruit trees planted in a climate and soil which hastens maturity, have their periods of fruitfulness shortened proportionately.

Seed Coffee is being introduced into Los Angeles county from the Sandwich Islands.

The Chicken Question Again.

More attention is being given to breeding fine stock of all kinds, in this State, than ever before; and as the country becomes more densely settled, and a more thorough and economical cultivation is necessitated, the advantages and profits of the best breeds of stock over ordinary sorts will become apparent. It must be a real pleasure to every progressive agriculturist to note whatever enterprises favor the speedy introduction and dissemination of the superior kinds; as also the best methods of improving ordinary stock—a matter which is too often disregarded. Increased attention is apparently being given to

Poultry Raising.

This is usually regarded as a small business; but the average profits accruing therefrom certainly exceeds that of most others, according to the amount of capital invested. It furnishes many families the small sums so convenient to purchase the little necessaries and luxuries that amount to so much in comforts and gratifications. The farmer that engages in a large number of little enterprises and experiments pertaining to his calling, is not idle half the year at bar-rooms and jockey clubs; but finds time to appreciate the nobler enjoyments and comforts of home, and to cultivate the little refinements of intelligence and noble aspirations. Whoever despises little things enjoys not much.

The Brahma Pootra Fowls.

As I have been requested to correct my late hasty description of the Brahma Pootra fowls seen at Mr. Nichols' place near Brooklyn; in justice to the subject, I present the following, made up from a closer observation, and some extracts from standard authority:

The Light Brahma Pootra fowls are quite large, and of more beautiful proportions than most of the larger sorts. They are mostly white, finely penciled with black, the rump hackles slightly tinged with gold. Their gait is stately and graceful; they are quiet and peaceful in their disposition, no great scratchers, and but little inclined to wander. The tail is black, upright and fan-shaped, with short, glossy, green plume-feathers.

The wings appear white when folded; but the flight feathers are black. The head is surmounted by a tripple pea-comb; beak, white, strong, well curved; wattles, full; ear lobes, pure red, well rounded—falling below the wattles. Legs, yellow, covered with white feathers, often mottled with black. The neck-hackels are streaked with black down the center of each feather.

A very low fence will stop them, and when well fed are not guilty of depredations on the garden. They are heartier eaters than common fowls, and may be kept on coarser food. Being great layers, they require full keeping. They lay daily, while they do lay, and stop but a few days between broods, when not allowed to set.

Mr. Nichols, who keeps a finely arranged day-book of details, furnishes the following:

Trial of Light Brahmas.

1st triplet. Cock and two pullets, late spring chickens, imported. One commenced laying the 22d of December, the other the 25th of January last, and up to this time (March 11th) have laid 105 eggs. Seventy of these they have laid since February 1st.

2d trial. Six pullets of the same variety of previous importation, selected, and put in breeding yard January 1st, 1870; have averaged thirty-two eggs per week ever since.

I find it generally claimed in the written testimony of poultry fanciers, that the Brahma Pootras are the best layers of any known sort. It is also claimed that when fattened for the market they are equal to the best table fowl. They are also hardy and remarkably free from disease; and their peacable habits and fine appearance renders them a very desirable acquisition.

Remarks and Suggestions.

Thorough breeding and attention to their wants, and good feeding, have probably produced these results; and indifferent care would undoubtedly soon degenerate them into ordinary dunghills. It is quite as important to improve ordinary sorts, to breed from the best, to feed well, shelter and keep clean and healthy, as it is to get the best, and *more* should the after care of such be neglected.

It appears to be a fact that all highly-bred fowls have a finer nervous organization than common breeds. The young, especially, are of more delicate constitution, and require shelter and careful attention to insure success. Coarseness and inferiority in fowls, animals and every human being, is the result of hard fare, irregularity, negligence and abuse. Our best moral philosophers are recognizing the force of material effects. While it is worth much to obtain good breeds, it is also equally important to care for what you have.

Feeding.

Fine meal should never be fed to fowls unless first baked into bread. Coarse meal is best, the coarser the better, and just sufficient water to wet it. Such sorts of grain that have coarse hulls, like barley and oats, should be broken before fed, as the harsh hulls sometimes fatally injure the crops. For fattening, Indian corn is superior. For the production of eggs a variety of foot is necessary. In every case regular hours of feeding should be observed. Also certain kinds of food should be fed at certain hours; for instance, meal and meat in the morning, vegetables, fruits etc., and mixed sorts of seeds at noon, and corn and wheat at night. Young chicks should be fed several times each day. I cannot close these remarks without again warning the thoughtless against the use of *smut wheat*, a poisonous and filthy feed. Use only clean feed, and supply clean water.

S. H. Herring.

Butter in Oregon and California.—Two years ago Eastern butter was imported into Oregon, and money going out of the State to pay for the same. Attention was called to the fact by the Willamette *Farmer* and other papers in the State, and the farmers urged to turn their attention to the production of at least as much butter as was needed for home consumption. This year Oregon will probably produce all the butter she needs and some to spare. In fact she is already exporting that article to British Columbia—Mr. J. M. Harrison, of Marion county, having lately sent thither one ton at a single shipment. Why do not our California farmers imitate this example? It is a shame and reproach upon this State that she should be dependent on the East for a single pound of butter or cheese. Yet more than half the butter consumed in California is brought to our tables over 2,000 miles of railroad or 10,000 miles of water carriage.

Death of an Inventor.—We are pained to announce the death of Mr. W. D. Robertson, well known as the inventor of a railroad track-laying machine, and more lately of a machine for ditching in the tules. Mr. R. was engaged with his machine on an island in Suisun bay, and having occasion to go to the neighboring main land in a small boat, while on his return with only a single companion, the boat was upset. With much exertion both parties reached the shore; but being unable, for lack of strength to reach aid or shelter, Mr. R. perished from exposure before aid reached them.

The latest as well as the previous invention of Mr. Robertson was one of much value. At the time of his death it had been on trial for several weeks, and had been pronounced a decided success. The machine is built on a scow that floats in a ditch cut by itself, and is provided with knives and scoops that cut and throw on each side of the ditch the earth that it takes out in its progress. It is worked by an engine of ten-horse power and requires three men to attend to it. The cut made by it is twelve feet wide by three and a half deep. It throws out about one and a half cubic yards a minute, and it is expected that when the men shall have become better acquainted with its working the amount will be increased to two yards a minute.

* * *

Patent Secured.—C. C. Stevenson, proprietor of the Douglas mill, Gold Hill. has been granted, through the Scientific Press agency, a patent for an improved amalgamating pan, which is constructed with plow-shaped mold boards, or flanges, for gradually raising the quicksilver and forming an easy and regular flow of the pulp to the center of the pan. This pan has been run for months, with highly satisfactory results. It will probably be illustrated in our columns soon.

* * *

The track of the new street railroad, designed to extend to the beach, has been laid on Larkin street, from Sutter to Market, and on Ninth street, from Market to Mission.

The New Gold Fields.

The San Diego gold excitement has subsided to a very considerable extent. The people who went there are re-learning the lesson, that labor is necessary to the acquisition of wealth. The weather has been cold, rain has poured down and the gold has not been lying on the surface in big enough lumps. Still there is considerable probability that there is money to be extracted from the mines by proper working.

Some 800 men are on the ground, and about thirty claims have been located, although the ledges are explored only to a slight degree. The George Washington is said to be opened to a depth of fifteen feet. The Hayden lode is reported to be rich and also the Good Hope. Besides these we hear of the Mammoth, Swain's, Warpath, Wasboe, High Peak, President and others. Silver "indications," whatever they may be, are reported. The placer diggings seem to be given up as too poor, even for Chinamen, it is said.

Julian City contains two log cabins and some twenty tents, and Coleman City, three miles west, about a dozen tents. A town site has been laid out near the Washington mine, and lots are for sale. Living is comparatively cheap, fair meals being obtainable for fifty cents. A new wagon road to San Diego is projected and quite a large amount subscribed therefor.

A correspondent of the San Diego *Union* writes as follows concerning the surrounding country:

Many very valuable ledges have undoubtedly been found, and I believe many more are yet to be discovered. This whole region is evidently rich in mineral deposits. It is a spur of the Sierra Nevada range, splitting off at Owen's Lake, one spur running southerly through the counties of Los Angeles, San Bernardino and San Diego to the peninsula of Lower California, and the other running southerly across Arizona into Mexico. Like the ranges above Owen's Lake, the slopes on the east are argentiferous, while those on the west are auriferous. It is in this western range that the recent gold discoveries have been made. Not more than sixty miles north of the Cuyamaca mountains, in San Bernardino county, are the gold deposits of Lytle Creek, which have been worked for the past six years, and from which several hundred thousand dollars have been extracted. Running northerly, these gravel deposits continue almost uninterruptedly, terminating in what is known as the San Feliciana district in Santa Barbara county. The only quartz ledges worked are those of the Soledad district, in Los Angeles county, midway between San Feliciana and Lytle Creek, which are paying well. San Feliciana is the point where gold was first discovered in California. At Lytle Creek there are now hydraulic works, which are said to pay from $1,000 to $1,500 per week.

But here in San Diego county, quartz is our reliance; and it is the opinion of quartz miners of many years' experience that nowhere in California has so much rich quartz been found distributed over so large a surface of country.

A ledge that has not yet attracted special notice is that known as the "Wetherby" lead, at San Pasqual. It has been imperfectly worked and has yielded an average of $33 to the ton. It was abandoned two years since, owing to the want of capital to pump the water out. This mine is on the western edge of the Cuyamaca district, and quartz lodes are traceable from this point to and beyond the Cuyamaca Mountains.

Intermediate between the Wetherby mine and the Cuyamaca district lie the Santa Maria placer mines, which have been worked at intervals during the past twelve years, yielding fair returns in the rainy seasons. The want of water during a great portion of the year prevents extensive operations.

* * *

We have to acknowledge the receipt of Reports of the U. S. Commissioners to the Paris Exposition on Mining and the Mechanical Preparation of Ores, and on Civil Engineering and Public Works, for which we return thanks to the able editor of the reports, Prof. W. P. Blake. We shall cull from these several interesting facts hereafter for our readers, but for which we have no space this week.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending March 15th.

Steam-Engine Slide-Valves.—Andrew J. Stevens, San Francisco. Antedated March 5, 1870.

Sluice-Box for Gold Mining.—John H. Whitney, Helena, Montana Territory. Antedated March 5, 1870.

Track-Laying Machine.—John R. Adams, San Francisco.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Grain and Straw-Carrier for Separators.—B. Jackson and B. F. Jackson, Woodland, Cal.—This is an improved device for carrying a supply of unthreshed straw from the stack to the separator. It is simple and economical, and can be easily attached to any separator. It consists of a spout of sufficient length, supporting a carrying belt moved by a pulley, which is connected directly with the machine. The spout extends from the feeding-tables to the stack, where it is supported by two legs, whose lower ends are driven into the stack, while the upper ends pass through staples in the sides of the spout, and are there fastened by set-screws or other device, so that the spout may be depressed as the stack is lowered. The shaft of the pulley which drives the carrying-belt, rests in open slots in the sides of a frame which is pivoted at the top and bottom, allowing the spout to be swung around as desired. This shaft is driven by a belt running over a pulley driven by the main belt, and thus the carrying-belt is driven in the most direct manner and without too much extra machinery. The spout is very easily removed when necessary. By this device the labors of the feeder are somewhat lessened, fewer men are required on the stack, and the amount of work done by the machine can be materially increased.

Improvement in Desulphurizing Ores. Elizabeth A. Burns, Meadow Lake, Nevada Co., Cal.—This invention has been described and illustrated in the Press of July 17, 1869. It consists in subjecting the ore to a burning process in a peculiarly constructed furnace and then treating it in a certain solution, which, it is claimed, leaves it in such a disintegrated state that the gold can easily be separated and can be amalgamated readily.

Commissioner of Patent's Decision.

COLE VS. LOUD.

We mentioned the decision in this case some time since, and as there appears to be much interest manifested in the matter at present, we beneath give the decision in full:

In the matter of the interference between the applications of Cornelius Cole and Alfred C. Loud for letters patent for improvements in propelling wheels:

In this case a quarrel between the applicants has borne the usual fruit of much irrelevant testimony. The material facts, however, are few, simple, and undisputed.

Although the parties were connected in business matters closely allied to the invention in controversy, it is not denied by either that the other is an independent inventor. The controversy is, therefore, narrowed down to a mere question of dates of invention; and even as to these there is a substantial agreement.

It is conceded by Loud that Cole made the invention, without assistance from him, about the middle of December, 1868. The only remaining question is, therefore, Did Loud make it at an earlier period?

The history of Loud's invention is briefly as follows: In August, 1868, having been interested in the subject of propelling wheels for steamers, he produced two small discs of pasteboards, about the size of a half dollar, through the center of which he thrust a match, as a shaft. This he exhibited to his wife, her sister and a male friend. In conversing about his plan, he put the discs on the shaft and brought them together at one point in the circumference of each, so as to form a V-shaped wheel, and he also, by means of slits, crossed them so as to form an X-shaped wheel. He was experimenting, or rather theorizing, about his plans, and used these discs by way of illustration. He finally settled upon the V-shaped wheel, and came to the Atlantic States to patent and introduce it. He filed a caveat and finally obtained a patent for the V-shaped wheel; but neither in his caveat nor in his patent did he so much as mention the X-shaped modification. While in Washington, he met Cole, who agreed to furnish capital for actual experiments. A small steam yacht, called the Julia, was purchased, which was furnished with the V-shaped wheels. When put in motion, however, the discs were found to be placed at too acute an angle, and the slip in the water was too great. A greater angle was needed, and the problem was to obtain this angle without unduly increasing the width of the wheels and paddle boxes. This question was considered by Loud and Cole and their assistants for an entire month without result, at the end of which time Loud returned by sea to California. On the day that he sailed, Cole made the invention of the X-shaped wheels, which gave him double the angle in the same width of wheel. Loud's story can best be told in his own words:

"After leaving New York, while on the steamer, I made many experiments with this wheel for the purpose of overcoming the difficulties we had encountered while in New York; and, reflecting back, I recollected that I had the old pasteboards put away with which I first made the invention, and which are the same ones heretofore exhibited.

In making this discovery in August, 1868, I put the slits in the pasteboard into each other, and put the axle through, as described in my specifications or oath of invention, January 2, 1869.

The recollection of the crossing of the pasteboard discs induced me to cut out the two rims and cross them in the same manner, and this occurred on the 24th of December, 1868, on board the steamer Montana, on this side, while on my way to San Francisco.

Upon arrival I made further experiments, and concluded that this application of the principle overcame many of the objections which had occurred while making the experiments before leaving New York." He is subsequently asked, "In all the time that you were experimenting with your wheels on the yacht Julia, did you ever suggest to any one the plan of improving said wheels by crossing the discs or rims, or by bending them so as to give them the form of discs or rims crossing each other?" and answers: "I have before testified that my first bending their rims was done on the steamer on my way to San Francisco, in December, 1868, and that this bending of rims called to mind the application I had made months before in my original pasteboard model by means of the slits cut therein at that time. Of course I could not have suggested it at the time of the experiments on the Julia."

He is then asked: "Then, during the time you were experimenting with the Julia, you had no recollection of ever having crossed the pasteboard discs, had you?" and replied: "My first intersecting application was not in my mind at that time."

Now, when did Loud make this invention of the X-shaped wheel? In California, in August, 1868, or on the Montana, in December, 1868? If at the former time, then priority is with him. If at the latter, it is with Cole.

Invention, within the meaning of the patent law, is the conception of some new and useful thing and the embodiment of that conception in a practical form. I think it cannot be doubted that the definition must include an intelligent conception. It must require that the inventor shall know that he has found something, and be aware, at least, that it is capable of use. If he thoughtlessly puts two bits of wood together and then throws them away, without having observed that their union was new and useful, he cannot be permitted afterwards, when another has done the same thing, with a purpose, to recur to that which he did without purpose, and dignify it by the name of invention.

I am clearly of the opinion that Loud made no invention of the X-shaped wheel in August, 1868. It is true that he crossed two discs of pasteboard; but he had no idea of the mechanical truth which that act involved. On the contrary, when it became desirable to make use of that truth it was not in his mind. The necessity of finding it compelled him to make search, and to arrive at a solution of his problem in the ordinary way in which inventions are made. When he had made the invention and had perceived that it supplied his want, it recalled the purposeless experiment of a few months before.

Except for the invention on the Montana, that experiment had been as thoroughly lost as if it had never had an existence. That it has been recalled cannot avail Mr. Loud, in view of the unsatisfactory character of the experiment itself, his utter forgetfulness of it when it was needed to solve the problem with which he grappled for a month in New York, and the fact that the invention on the Montana was not the effect, but the cause of its resurrection.

The decision of the Board of Examiners-in-chief is reversed.

Priority is awarded to Cole.

Sam' S. Fisher,
Commissioner.

February, 8, 1870.

* * *

On the 22d instant the Senate passed the Act for the endowment of the State University, which in effect, gives this institution an annual income of $50,000 until the income from its lands render this aid unnecessary.

Railroads of San Francisco.

Ten years ago our first railroad, on which locomotives were run for passenger traffic, was built in this city. This was the Market street road on which work was commenced in May, 1859, and finished in July, 1860. The first rail was laid June 7th, and the track was completed July 4th, 1860. It was a short road, only three miles in length, and on it first horse-power, and then dummy engines, were employed; and, with the exception of the rails, everything was of California manufacture, and it is worthy of mention as the pioneer road in the city and the third in the State. This road is still used, but horse power is again employed.

As early as 1851 the importance of railway communication between the city and San José was recognized, and a route was surveyed by W. J. Lewis. Here matters rested for a while until a second survey in 1855, when another pause occurred. In 1861, active operations under the same engineer were commenced, and about June, 1863, the whole distance of 50 miles was opened to passengers and freight. Messrs. McLaughlin & Houston did the work under contract for the road. In 1868-69 the road was extended to Gilroy, and, according to present indication, the line will soon be run still further south.

In 1861, the San Francisco and Oakland Railroad was started by Geo. Goss and R. L. Harris. It was rather difficult at first to persuade landholders along the line, which runs from Oakland Point to Clinton, a distance of four miles, of the value to them of such a road, of which fact, however, they have since become fully convinced. Recent events, moreover, have verified the prediction of the originators of the plan, that this road would form one end of the great Pacific Railroads.

About 1864, the San Francisco and Alameda Railroad was commenced. This road is fourteen miles long, was engineered by L. H. Short, and run principally by A. A. Cohen.

On the Western Pacific work was commenced on the first of February, 1865, under the charge of W. J. Lewes, and twenty miles were built, when, in 1866, operations were suspended, until it passed into the hands of the Central Pacific, which completed it in 1869.

On the San Francisco and Humboldt Bay Railroad, designed to connect by steam this city and the northern part of the State, ten miles were graded in 1868, between Petaluma and Santa Rosa. And last year the San Rafael and San Quentin road was built, and the first train has been run this week.

The remaining road, which connects this city with other parts of the State, is the California Pacific, from Vallejo to Sacramento and to Marysville, in regard to which fuller data have been obtained by us, and a map of which we present to our readers. From San Francisco to Vallejo, a distance of 23 miles, communication is established by means of the company's fast steamers. The railroad runs from Vallejo north to Adelante, which, being interpreted, meaneth "go ahead," thence northeasterly to Vaca Station, and then to Davisville, which is 45 miles from Vallejo. Here one branch runs nearly due east fourteen miles on a direct line to Sacramento, while another runs to Knight's Landing, here crosses the Sacramento river and continues on to Marysville, where it crosses the Feather river.

The road has opened up a rich agricultural country and has given birth to several towns, and increased the prosperity of the whole region. As one is carried up the bay from San Francisco, rapidly transferred to the cars at the flourishing town of Vallejo, where one catches a glimpse of the great elevator, and whirled by Adelante, Summit, Bridgeport, Fairfield, Vaca Junction, Davisville and other places, or runs up to growing Napa and pretty Calistoga, he sees abundant evidence of the benefits bestowed, and the increasing popularity enjoyed by this particular line.

A portion of the road from Knight's Landing to Marysville is built on embankments and piling over an overflowed plain of tule land, some fifteen or twenty miles long and eight miles wide, where the water stands two to twenty feet deep. Fears have been expressed that this part of the road was not strong enough. These have so far proved entirely groundless. The earth has not been washed at all by the water and no trouble has been experienced, except, perhaps, a slight cracking caused by the weight on top of the bed, which has been remedied by placing sand-bags and planking along the edge of the embankment. To make everything still more secure, willows have been planted and alfalfa sown, while every day the work is being rendered more solid and complete. It is proposed, moreover, to raise this embankment two feet higher. The one and an eighth mile of trestle work over the tules cost at the rate of $50,000 per mile, and the bridges at Knight's Landing and Marysville were built at an expense of $40,000 each. From Vallejo to Davisville, the road was built by a track-laying machine, and has at present the chair rail, which is, however, to be replaced by the fish or strap rail, used between Davisville and Marysville.

Work was commenced at Vallejo in December, 1866, and the road was completed to the Sacramento river in November, 1868, and to Marysville in November, 1869. The engineers were R. L. Harris and D. B. Scott. The rolling stock comprises 13 passenger and freight locomotives (two of which, "Ryder" and "Rice," are the most beautiful engines), 3 smoking cars, 6 baggage, 3 express, and 20 box cars and 150 flats.

The history of this road is interesting as affording an example of California pluck and energy. Some ten years ago Mr. D. C. Haskin started to build a railway from Marysville to Davisville. He succeded in raising $100,000 from Yuba county, and built the embankment. He expended his own private resources in the work and struggled along manfully for years; but finally, by perseverance and energy, succeeded in interesting capitalists, and the road was completed with no other foreign aid than that just mentioned and $200,000 from Solano county. The management is determined to make it the best furnished and equipped road on the coast. It is the shortest route between this city and Sacramento or Marysville, being built on air-lines as nearly as possible, and its total length, inclusive of the route of the steamer, being 83 miles from here to Sacramento or 111 miles to Marysville, which is respectively 52 and 80 miles shorter than any other road to these places. For freight, the conveniences at Vallejo (and the grain elevator there deserves special mention) are unsurpassed. It has branches at Adelante to Calistoga (the Napa Valley Railroad 34 miles long, started in 1864 from Suscol to Napa, and completed in 1869; R. L. Harris, engineer) and at Vaca Station (to Vacaville, four miles), and this season it is proposed to build the Sonoma and the Red Bluff roads. Dr. D. W. C. Rice is President of the corporation. Mr. R. S. Mattison, the able Superintendent, and Mr. L. C. Fowler, General Ticket Agent, and others connected with the road are certainly doing their utmost to maintain and extend the credit they have deservedly acquired, and promise that the public will find this the safest, quickest and pleasantest road leading from this city to Sacramento and Marysville.

The *Bulletin* of the 23d inst. speaks as follows of this favorite route:

"Not only is travel constantly increasing, but the amount of freight passed over the road shows a notable gain within the past few weeks. On the 19th instant, 13 car loads of horned cattle were shipped by this route to San Francisco; 1,040 sheep, and one car load of cattle were sent here on the 21st, and on the 22d seven car loads of cattle. This live stock is generally from the west side of the Sacramento, in Colusa county. The freight-boat Vallejo now leaves the pier for Vallejo at four o'clock P. M., instead of five o'clock."

A WOOLEN mill at Napa is proposed, and $10,000 already subscribed therefor.

A Railroad Across New York Harbor.

The latest New York engineering project is the construction of a railroad-bridge across the harbor, to Staten Island, to be built upon a pile structure, some five miles long. The bridge will start from an extensive bulkhead, to be constructed about three-fourths of a mile from the Battery; this bulkhead to be connected with the city by double-ender ferry-boats. It is proposed to divide the bridge into three divisions—one for foot-passengers and vehicles, another for horse cars, and the third for steam cars. The scheme also contemplates the extension of the railroad across Staten Island and the connection of its southern extremity with Perth Amboy, on the main land of New Jersey, by means of another bridge. Both the bridges will have "draws" ample for the accommodation of shipping. The Camden & Amboy railroad, by adopting this route, would be able to reduce its time between New York and Philadelphia fully thirty-five minutes. It would also open up a wide area for dwellings, much more convenient and desirable than the same distance up the city, or across to Long Island. The estimated cost of the bridge is one million dollars. Some of the best engineers have pronounced the scheme perfectly feasible.

* * *

RIGHTS OF MARRIED WOMAN.—An Act under this title was approved by the Governor on the 9th instant, the main object of which is to protect the earnings of the wife and minor children, and not allow said earnings to be held liable for the debts of the husband. The bill provides that while the wife is living separate and apart from her husband, she shall have the sole control of her earnings and her separate property, that she may sue and be sued without being joined with her husband. She is also empowered to buy and convey real estate, in her own name. Before conveying, she is simply required to cause to be recorded in the office of the County Recorder, where the estate is located, the fact that she proposes to sell, a description of such property, the name of her husband, her own place of residence, and that she is a married woman living apart from her husband. Thirty days' notice of such intention is to be given in such a manner as the County Court may direct for a hearing of the matter, when, if it shall appear that the property really belongs to the woman, and that she is living apart, etc., then the Court will duly authorize the sale.

* * *

AN ENGINEER'S DEATH.—Andrew J. Lamaroux, chief engineer of the P. M. S. S. Co's steamer China, died at sea (of inflammation of the brain) on the 9th of March, on the way to this port from China. We have known Mr. L. personally as a gentleman of skill and proficiency in his profession, and a friend possessed of kind and noble traits. His death is sincerely lamented by all acquaintances, and especially his every-day associates and fellow officers. On the arrival of the China on Saturday morning last, his wife and youthful son were buoyant with the glad anticipation of meeting him, when the sad news of his death came in his stead. It is one of those sad cases which must occur so long as self-sacrificing men follow the sea. The body, embalmed, will be accompanied by the widow and son on the next steamer for New York. The sympathy of warm friends will go with them from the land in which they were comparative strangers.

* * *

NO-FENCE LAW.—The Senate has passed the Assembly bill, with amendments, extending the no-fence law over all that portion of San Joaquin county lying south of the Calaveras and west of the San Joaquin river, all of Stanislaus county, and all that portion of Merced county lying east of the San Joaquin. Also, certain settled portions of Santa Barbara, San Diego and Los Angeles.

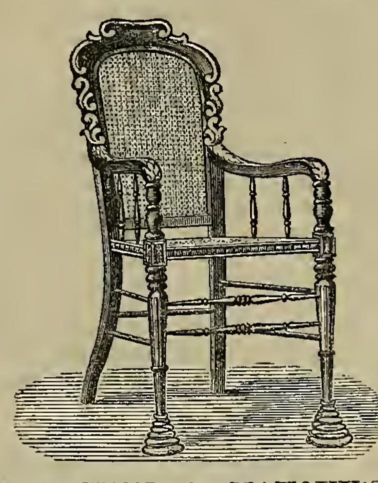
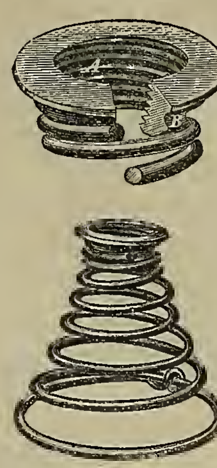
PATENT CHAIR SPRING.





PURINGTON & MAYOUX'S PATENT, NOV. 30, 1869.

This is the best Chair Spring yet invented, and will undoubtedly supersede all other devices of the kind, as it is SIMPLER, CHEAPER, AND MORE DURABLE. As a simple article of comfort and ease, it has no superior, and only needs to be tried to commend itself to universal and lasting favor. The Springs seen attached to the front legs of the chair in the engraving enables the person sitting in the seat, with very little effort, to give themselves

A Gentle and Easy Rocking Motion,

And also to rest themselves by change of position, by a very slight movement. It renders a common chair, at a trifling expense, equal or superior, in many respects, to a rocking chair.

The advantage of this Spring over all others consists in the manner of attaching it to the chair by the simple turning of a nut, which nut is also securely, easily and quickly adjusted to the Spring in a manner impossible for it to become inadvertently detached. The engravings show the parts both detached and as adjusted to the chair.

The nut is made of metal, and is provided with a screw thread, so that it can be screwed to the leg of an ordinary chair; and instead of weakening and splitting the leg, as in the case where a hole is bored and a screw inserted to hold and attach the nut, this method strengthens it The nut can also be very quickly and easily put on or removed.

The ease and convenience in applying the spring to the nut is readily seen. The top of the nut is provided with a collar or shoulder, and also an incline groove around the outer surface, so that the smaller end of the pan can be screwed to the nut; and its top coil being brought firmly against the shoulder, all oscillation from side to side is prevented. When the nuts are taken off, the chair is uninjured in its original form.

THIS IS A CALIFORNIA INVENTION,

And a superior article is now being manufactured. For particulars apply to

A. MAYOUX, Marysville,

Or inquire of PAUL N. ROTH, No. 809 Montgomery street, San Francisco. 9v20-1amq4

USE

DR. S. GIRARD SMITH'S

ARAMIRACULAS

— FOR —

RHEUMATISM, GOUT AND NEURALGIA.

CURES GUARANTEED.

Has cured Thousands. Has never been known to fail. One bottle will relieve you.

OFFICE, No. 621 KEARNY STREET.

Agents Wanted in every City and Town.—Terms Liberal.

DR. S. GIRARD SMITH, 621 *Kearny street.*—Dear Sir: It would be hard for me to say how much I thank you for the benefit your ARAMIRACULAS has conferred on me in curing my RHEUMATISM. I was confined to my bed when I first commenced to take your medicine, and after using ONE BOTTLE I am now able to work as well as before. If you know anything about having that afflictive complaint, you must know how good it is to be cured. I will state to those who may not believe in your medicine, that they can be convinced by referring them to me. Very respectfully, yours,

ENON HARRIS,
Everard's Auction Rooms, 527 Kearny street.

Statement of an old and well-known Physician who has practiced extensively in Europe and America.

We must admit that the many systems of medicine by which we have attempted to heal the human body, and rid it of disease, from the science of ALLOPATHY down to HYDROPATHY, how little they have succeeded, time has abundantly shown by their number of failures. In the cure of RHEUMATISM, GOUT and NEURALGIA, Dr. S. Girard Smith has laid aside the old way and adopted a system, so simple, that I must admit, is so natural and direct, that it recommends itself to all who are suffering with the above diseases. And it challenges and defies all the old methods of treatment. Although I have been educated through a regular course, and graduated in Europe, I must acknowledge the right, and also give due credit for personal benefit received by the new system as practiced by DR. S. GIRARD SMITH, which induces me to bear this testimony to its merits, for the benefit of suffering humanity.

A. M. HOFFMAN, M. D.,

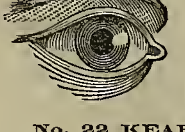
DR. ABORN,



Oculist, Aurist,

AND

CATARRH, THROAT

AND

Lung Physician.

No. 22 KEARNY STREET,

SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox. Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan, 10, 1870,

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.

WILLIAM BEARDSLEE.
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

Reading for the Hour.

Spontaneous Combustion of the Human Body.

The earliest case of supposed spontaneous combustion of the human body which has a semblance of authority to sustain it is said to have happened in 1725, and from that time down to the year 1847, when the last alleged case occurred, some fifty instances are recorded. Liebig made an analysis of all these cases in 1851, and found that they nearly all agree in the following points: (1) They took place in winter. (2) The victims were hard drinkers, and were drunk at the time. (3) They happened where the rooms were heated with fires in open fire-places, or pans of glowing charcoal. Cases where rooms are heated by means of closed stoves are exceedingly rare. (4) It is admitted that no one has ever been present during the combustion. (5) No one of the physicians who collected the cases, or attempted to explain them, has ever observed the process, or ascertained what preceded the combustion. (6) No one has known how much time has elapsed from the beginning of the combustion to the moment when the consumed body was found. Out of forty-five cases collected by Frank, of Berlin, in 1843, there are only three in which it is assumed that the combustion occurred when there was no fire in the neighborhood; and Liebig clearly shows that these three cases are totally unworthy of belief. The conclusion to which he comes is that "spontaneous combustion in a living body is absolutely impossible." Flesh which has been saturated with alcohol for a great length of time, as anatomatical preparations, is not combustible; if ignited, the alcohol burns off, scarcely scaring the flesh. The corpses of drunkards have never been found to be combustible. M. Duvergie has opposed Liebig's views, and has expressed the opinion that molecular changes may take place in the living body by which it becomes more combustible from the absorption of alcohol, or from its conversion into more inflammable compounds; but he admits that the combustion is probably never spontaneous. Dr. Marc has suggested that inflammable gases, and possibly even phosphoreted hydrogen, which, under certain circumstances inflames on contact with the air, may be generated in the living body, and may thus give rise to its spontaneous combustion; but this is merely a theory to account for such cases of combustion, if they have occurred—*The Engineer.*

How the Pheasant Drums.—Very few persons ever saw the ruffled grouse *(Bonasa umbellus)*, commonly called pheasant in the Western States, and partridge, in New England, in the act of making that peculiar noise called "drumming," for the reason that the bird never drums except when in a close thicket. For this reason, the manner in which it is done has been differently described by hunters. Some say the bird beats its wings upon a log; others, that it beats its body. A gentlemen who recently had an excellent opportunity of witnessing the act, writes to the *Journal of Agriculture* that the bird simply "beats the air" with its wings, as in the act of flying—the wings, during the act, being fully distended at right angles with the body. The sound is the same as that made in the act of flying, being made in the same way.

How to Treat a Burning Chimney.—If it is desired to extinguish the fire in a chimney which has been lighted by a fire in the fire-place, shut all the doors of the apartment so as to prevent any current of air up the chimney, then throw a few handfuls of common fine salt upon the fire, which will immediately extinguish the same. The philosophy of this is, that in the process of burning the salt, muriatic acid gas is evolved, which is a prompt extinguisher of fire.

Wood Oil.—There is a tree in India which yields a remarkable substance known as "wood oil." There was a consignment of this oil received here by the last China steamer. This oil is obtained from several species of *Dipterocarpus*, by simply tapping the tree.

A Strange Story.

Not many years since certain miners, working far underground, came upon the body of a poor fellow who had perished in the suffocating pit forty years since. Some chemical agent to which the body had been subjected—an agent prepared in the laboratory of Nature—had effectually arrested the progress of decay. They brought it up to the surface, and for a while, till it crumbled through exposure to the atmosphere, it lay the image of a fine sturdy young man. No convulsion had passed over the face in death—the features were tranquil, the hair was as black as jet.

No one recognized the face—a generation had grown since the miner went down into his shaft for the last time. But a tottering old woman, who had hurried from her cottage at hearing the news, came up, and she knew again the face which, through all these years, she had not forgotten. The poor miner was to be her husband on the day after that on which he died.

They were rough people, of course, who were looking on; a liberal education and refined feelings are not deemed essential to the man whose work is to get up coal or even tin; but there were no dry eyes when the gray-headed pilgrim cast herself upon the youthful corpse, and poured into its deaf ear many words of endearment unused for forty-six years. It was a touching contrast, the one so old, the other so young. They had both been young those long years ago, but time had gone on with the living and stood still with the dead.—*London Herald.*

Interesting to Coffee Drinkers.—When the coffee fields of Java are just turning from a sombre to a crimson hue—the sign that the berry is just ripening—the fields are visited by great numbers of little marten-like animals, called the "musang," which feed with great avidity upon the ripened berries. The soft, pulpy substance which envelops the berry at this time is that which attracts the little animal, and of this, as a food, it is extremely fond. This pulp is readily digested in the musang's stomach, the gastric juice of which, however, has no effect upon the berry itself. As a result, the ground is more or less covered with the whitish excrements of this little long-tailed *rodent*, which consists wholly of agglutinated, but otherwise unchanged coffee-beans. These beans are carefully gathered up and sold, at the highest price, mostly to the wealthy Dutch residents of the Island, because they are said to make the best coffee. The fastidious animal is more discriminating than the most experienced pickers, and never selects any but the very choicest of the berries for his food.

Aristocratic Marriages.—Some of the young ladies of high-toned Eastern families of recent elevation to wealth, have been endeavoring, of late, to unite themselves to the nobility of Europe, and have succeeded admirably in getting just what they deserve. Not having sufficient sense nor culture to be able to discern between the genuine and the fictitious article, they have the first cousin of Lord Brougham or nephew of Count Bismarck who came along, and have married these noble individuals, who invariably turn out cheats and gamblers. We have no sympathy for either the female or the male parties in the transaction, which is a swindle on both sides.

The Cow Tree.—On the parched side of a rock on a mountain in Venezuela grows a tree with dry and leathery foliage, its large woody roots scarcely penetrating into the ground. For several months in the year its leaves are not moistened by a shower—its branches look as if they were dead and withered; but, when the trunk is bored, a bland and nourishing milk flows from it. It is at sunrise that the vegetable fountain flows most freely. At that time the blacks and natives may be seen coming from all parts, provided with large bowls to receive the milk, which yellows and thickens at its surface. Some empty their vessels on the spot, while others carry them home to their children. One imagines he sees the family of a shepherd who is distributing the milk of his flock. It is named the *palo de vaca*, or cow tree.

Report of Samuel S. Fisher, Commissioner of Patents.—1869.

CONTINUED FROM PAGE 169.

Qualifications of Examiners.

Although ample means are provided for the correction of an erroneous decision of an examiner, when adverse to the grant of letters patent, there is no check to his action, when favorable to the applicant, except the general authority lodged in the Commissioner. But it is impossible to revise the cases that are passed for issue except in special instances. It becomes very important, therefore, to secure competent men for positions of such responsibility. An examiner should be a man of great patience, industry and honesty, of varied and yet thorough mechanical and scientific attainments, with a good knowledge of patent law, and a mind capable of the nicest discrimination. Though many men offer themselves for the position, but few are fit to fill it. As a rule, it is entirely safe to say, that no man should be appointed a principal examiner who has not served as assistant, thus becoming thoroughly conversant with the practice of the office, and demonstrating his capacity. But the demand for qualification does not apply to examiners only. So numerous are the applications for patents that assistant examiners, and even examiners' clerks, are charged with a portion of the duties of examination, as soon as it is possible thus to employ them.

Other clerical positions in the office require in the incumbents a knowledge of the different classes and machines, that many men do not possess, although they may be otherwise competent as clerks.

It is obvious, therefore, that the ordinary rules regulating the appointments of clerks in other bureaus cannot safely be followed in this.

The American System of Patents.

Letters patent for invention in this country are in the nature of a contract between the public and the original and first inventor, whereby he receives the exclusive privilege of exercising his invention for a limited time, as a compensation for his time, ingenuity, and expense in perfecting the invention and reducing it to practice; for the communication of it to the public, and for their right to use it freely when the exclusive right of the patentee expires.

An invention is property of the highest order. Whatever may be said of the right which men may acquire in the soil, by his occupancy of it, or in the materials with which he works, or in the profits of his barter, it would seem to be a self-evident proposition that he is the owner of that which he creates; and that when his ideas, no longer vague or dreamy speculations, have taken useful form and been reduced to practice, not the abstract ideas, but the concrete and embodied principles are his own, to dispose of as he will.

As it is impossible to pay for useful inventions in money, we pay in time, which the inventor must turn into money if he can.

To insure the fairness of this transaction, under the patent laws of the United States, an examination is made into the novelty of the invention prior to the granting of the patent. This investigation includes an examination of the patents already granted, of the applications rejected, of the foreign patents, printed copies of which are furnished to us, and of the text books and cyclopedias. In making the examinations reliance is placed for the most part upon the drawings; the text and models being resorted to only where the drawings are obscure and need further explanation.

Bennefits and Difficulties of Examining Applications.

As nearly one hundred thousand patents have been granted, and fifty thousand applications have been rejected, in this country alone, it is manifest that this examination is not an easy task. It would be impossible to make it without a careful classification of the subjects of invention, and without the assistance of trained and skillful examiners. With these appliances it is for the most part accurately made at a cost of only fifteen dollars for each application.

I do not hesitate to say that such an examination made by skilled, sworn, and impartial experts, is more thorough and satisfactory than it would be if made at much greater cost by solicitors, who made it in the interest of their clients.

Accordingly, the history of patent litigation will prove that but few patents have been held to be void by reason of the existence of prior inventions, the knowledge of which was within the reach of the Patent Office. The great source of litigation is the conflict upon the issue of infringement, or the effort on the part of the inventor to carry the patent beyond the limits assigned to it by the office at the time of its issue.

However good the patents may be, as representing an invention of undoubted novelty and technical utility, doubtless many of the inventions covered by them prove worthless upon practical test. The number of useless inventions is, however, much less than is commonly supposed.

Our patent laws have proved such a stimulus to invention, and have fostered so many valuable improvements, that we can well afford to patent some trash. A patent for a useless contrivance does but little harm, if it carefully defines the invention, since men will neither use nor steal that which is good for nothing. It must, however, be borne in mind that many good inventions are not developed for want of means, and many are laid aside because, although good and useful, and in advance in the art to which they belong, others, their contemporaries, are so much better and cheaper that they catch the public eye and secure the market.

Whenever the need of a new invention is suggested, the Patent Office is inundated with the applications of those who attempt to supply the demand. Some of these are crude, but suggestive of improvements, and very many are useful. Some few, however, in each class will prove to be the best and cheapest, and these alone will come into notice to the exclusion of others. The protection afforded by the patent and the hope of reward have proved the incentives to invention, and the public, enabled to choose from many devices, obtains the best thing.

Of course, the larger number of patents now granted are for improvements, and for new combinations. Some of these are doubtless trivial, while many are of real benefit. The issue of patents for mere technical combination is mainly due to the present system of patent soliciting.

[TO BE CONTINUED.]

New Tunnel at Chicago.—A second tunnel is to be built under the Chicago river at Chicago, for the purpose of connecting the two parts of the city. Under the river it is to consist of three passageways—one for foot passengers and two for vehicles; the eastern passage to be twelve feet high and ten feet wide, the others eleven feet wide. Beginning at a point 150 feet each way from the center of the river, the section of the tunnel changes to a single passageway; at this point 24⅓ feet wide and 21 feet high, and 40 feet nearer the banks, 19½ feet wide. The total cost is estimated at $475,000.

To Miners, Millmen and Metallurgists. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, $7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

Layres' Elements of Composition.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24w

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Business Fortunes are often made easily, quickly and legitimately by Patent Rights. We advise both sellers and purchasers to patronize reliable agents only. Weister & Co., patent brokers, No. 314 Bush street, San Francisco, are one of the most honest, reliable firms in the United States. *

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

New Mining Notices.

Alban Gold and Silver Mining Company.—

Location of Works: Virginia City, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of March, 1870, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to Geo. Bordwell, Esq., President of said Company, at his office, No. 432 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Monday, the twenty-fifth day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourteenth day of May, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. B. SMITH, Secretary.

Office, 432 Montgomery street, San Francisco. m26

Latawana Mining Company.—Near Hamilton City, White Pine, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of March, 1870, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 614 Merchant street, Room 26, or at 526 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth (10th) day of May, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.

Office, 614 Merchant street, Room 26, or 526 California street, San Francisco. mar26

North San Francisco Homestead and

Railroad Association:—Location of Property: City and County of San Francisco, State of California.

Notice.—There are delinquent upon the followed described stock, on account of assessment levied on the ninth day of February, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
B F Moulton	281	1	$7 50
John A Zoller	60 226	5	37 50
James T Boyd	83 348	91	682 50
Prosper Huerne	98, 99 100	6⅔	50 00
Jno G Klumpke	143, 145 288	52	390 00
R Bayerque	146	30	225 00
Geo H Ensign	179 344	457½	3430 00
J B Richardson	246	10	75 00
M O'Neill	296	2	15 00
J O Shepherd	354	1200	9000 00
J W Hendrie	351	547	4102 50

And in accordance with law, and an order of the Board of Trustees, made on the twenty-third day of March, 1870, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the fourteenth day of April, 1870, at the hour of one o'clock P. M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

EDWARD C. LOVELL, Secretary.

Office, 415 Montgomery street, San Francisco. mar26

Pacific Pneumatic Gas Co.—Notice.—

A meeting of the stockholders of the Pacific Pneumatic Gas Company will be held at the office of the Pacific Iron Works, in San Francisco, on the First day of May, 1870, at 1 o'clock P. M., to consider the proposition to reduce the capital stock of said Company to the sum of two hundred and fifty thousand dollars ($250,000).

IRA P. RANKIN,
J. J. FELT,

Mining Notices--Continued.

Cordillera Gold and Silver Mining Company, Morelos Mining District, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of February, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company No. 321 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.

Office, 321 Washington street, San Francisco, Cal.

Eagle Quicksilver Mining Company.—Location of Works: Eagle Mining District, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of March, 1870, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 26 Hayward's Building, No. 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the sixteenth day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of May, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Office, Room 20 Hayward's Building, 419 California street, San Francisco. mar19

Green Monster Copper, Gold and Silver Mining Company, Inyo Mining District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of March, 1870, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold or silver coin, to the Secretary, at his office, No. 16 Montgomery Block, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the sixteenth day of April, 1870, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the second day of May, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

I. N. THORNE, Secretary.

Office, No. 16 Montgomery Block, San Francisco. m12

Glenwood Mill and Mining Company.—

Location of Works: Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1870, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the seventh day of March, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of March, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco. feb52

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until the sixth day of April, 1870, and the sale thereof until Wednesday, the twenty-seventh day or April, 1870. By order of the Board of Trustees.

mar12 O. D. SQUIRE, Secretary.

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of March, 1870, an assessment of two dollars ($2.50) and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 23d day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 220 Clay street, San Francisco. mar12

Nevada Land and Mining Company.—Location of Works: Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice.—There are delinquent on the following described stock, on account of assessment (No. 1) levied on the eighth day of February, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
f I Herr	unissued	2000	$50 00
R P Johnson	unissued	2000	50 00
H C Kibbe	unissued	2000	bal. 30 00
Thos G Taylor	unissued	2000	50 00

And in accordance with law and an order of the Board of Trustees, made on the eighth day of February, 1870, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 5, No. 302 Montgomery street, San Francisco, Cal., on Tuesday, the fifth day of April, 1870, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office, Room 5 No. 302 Montgomery street, San Francisco, California. mar19

Pocahontas Gold Mining Company.—Location of Works: Mud Springs, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of March, 1870, an assessment of four dollars per share was levied upon the capital stock of said Company, payable immediately, in U. S. gold and silver coin, to the Secretary, at the office of the Company, No. 419 California street, San Francisco, California

Any stock upon which said assessment shall remain unpaid on the second day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 28th day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. A. JENNINGS, Secretary.

Office, 419 California street, San Francisco, California.

Yosemite Mining Company, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of March, 1870, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to James T. Maclean, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on the seventh day of April, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-third day of April, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary pro tem.

Office, 220 Clay street, San Francisco. mar12

Valuable Ranch For Sale

NEAR HEALDSBURG.—In the fine valley of Russian River, three and one-half miles south of Healdsburg, on the west side of the river, is now offered for sale a splendid farm of 260 acres of land (minus eight by twelve rods occupied by a good school house), 100 of which is of the richest of Russian River bottom, eighty acres of which is now in small grain, not surpassed by any in the State, five acres in bearing orchard of the choicest selections, fifteen acres plowed for corn, and the remaining 160 acres is rich, yet rolling timbered land, five acres vineyard of choice selection. The Dwelling has ten rooms, not yet finished, and supplied by a good spring of excellent water, and cost above $12,000. The barns and outhouses are in excellent condition. The title is "Fitch Grant," which is undisputed. The entire farm is inclosed, about half with a picket and half with a rail fence, both in good condition. The farming utensils which are offered with or in the sale of the farm, are as follows: Five plows, two harrows, two cultivators, one Buckeye reaper; also twenty head of hogs. There are 200 redwood trees within about five miles of the premises, and wood enough to supply all the demands of the place. It is well known by all parties who have resided for any length of time on this coast, that the climate of Russian River Valley is lovely, healthy and not surpassed by that of any other place in the United States.

The reason for selling is, that the owner is getting too old to cultivate a farm, and wishes to close up his business and live more retired. The place is a rare bargain at the price asked for it.

For further particulars, apply to McLean & Hardy, Real Estate Agents, No. 338 Montgomery street, southeast corner of California street, San Francisco. 11v20

Our Home Physician.

AGENTS WANTED.—"OUR HOME PHYSICIAN."—New, complete, simple, reliable. The Pacific Medical and Surgical Journal says: "It is the best book on 'Popular Medicine' we know of." THE NEW AGE,
A Weekly Journal of Sixteen Pages.
The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the Arts and Sciences and General Literature; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco, 19v19

Patent Brokers.

WIESTER & CO.,
PATENT BROKERS,
314 BUSH STREET,
SAN FRANCISCO.

Patents Bought and Sold on Commission.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

BURGESS' PATENT PAPER FILE.

This is a recent patent, and one of no ordinary merit. It is light and complete, yet costs but little. In all file-holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much time and trouble. This device is easily adjusted, is not liable to tear the paper, nor let it loose. This patent is also used in combination with covers for forming music folios. Musicians who have seen it, speak in the highest terms of its value. No person can fully appreciate the Paper File or Music Folio without seeing one.

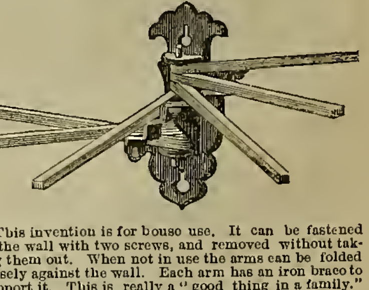
THE RANDALL RAKE.

Here is an article that we take pleasure in recommending. This patent has been for some time on this coast, but for want of means has been allowed to remain comparatively quiet. It will require from four thousand to six thousand dollars to handle this invention successfully on the Pacific Coast, and we would advise any one with this amount of capital to look into the merits of this patent before embarking in other business. We cannot see why it will not eventually supersede all other horse rakes. It does its work completely and is easily operated. It is so constructed that the teeth play on an iron rod independently of each other, and therefore accommodate themselves to any surface. The inclination of the teeth to the surface prevents them from raking up sand and dust with the hay, and causes them to glide easily over the ground. The driver has a spring seat to sit upon, and a simple action of the foot is all that is necessary to drop the hay. A complete model can be seen at our office, or references can be had to parties who have them in use on their farms.

LIGHT.

A Lamp that makes its own gas and burns it. No chimneys are required. It is equal to the best coal gas, and costs fifty per cent. less. Agents get the lamps at manufacturer's prices. This new light can be seen at our office, 314 Bush street, San Francisco. The Right for the State of Oregon will be sold cheap.

HOTCHKISS' CLOTHES DRYER.



This invention is for house use. It can be fastened to the wall with two screws, and removed without taking them out. When not in use the arms can be folded closely against the wall. Each arm has an iron brace to support it. This is really a "good thing in a family." County or State rights for this will be sold very low. Full particulars given on application.

A NEW SEED SOWER,

That can be attached to the Randall Rake at a cost of a few dollars, and is guaranteed to sow as well, if not better, than any other Sower in use.

A neat and convenient CUPBOARD LATCH, that answers equally well for single or double doors. It is suitable for Wardrobes, Wash-stands, Cupboards, etc.

A LOCAL AGENT wanted in every town on the Pacific coast to sell patent goods

WIESTER & CO.,

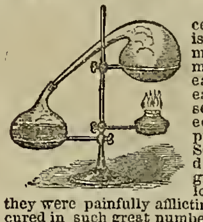
TO THE WORKING CLASS.—We are now prepared to furnish all classes with constant employment at home, the whole of the time or for the spare moments. Business new, light and profitable. Persons of either sex easily earn from 50c. to $5 per evening, and a proportional sum by devoting their whole time to the business. Boys and girls earn nearly as much as men. That all who see this notice may send their address and test the business, we make this unparalleled offer: To such as are not well satisfied, we will send $1 to pay for the trouble of writing. Full particulars, a valuable sample, which will do to commence work on, and a copy of *The People's Literary Companion*—one of the largest and best family newspapers published—all sent free by mail. Reader, if you want permanent, profitable work, address E. C. ALLEN & CO., Augusta, Maine. 5v20-3m

---

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.



The reputation this excellent medicine enjoys, is derived from its cures, many of which are truly marvellous. Inveterate cases of Scrofulous disease, where the system seemed saturated with corruption, have been purified and cured by it. Scrofulous affections and disorders, which were aggravated by the scrofulous contamination until they were painfully afflicting, have been radically cured in such great numbers in almost every section of the country, that the public scarcely need to be informed of its virtues or uses.

Scrofulous poison is one of the most destructive enemies of our race. Often, this unseen and unfelt tenant of the organism undermines the constitution, and invites the attack of enfeebling or fatal diseases, without exciting a suspicion of its presence. Again, it seems to breed infection throughout the body, and then, on some favorable occasion, rapidly develop into one or other of its hideous forms, either on the surface or among the vitals. In the latter, tubercles may be suddenly deposited in the lungs or heart, or tumors formed in the liver, or it shows its presence by eruptions on the skin, or foul ulcerations on some part of the body. Hence the occasional use of a bottle of this *Sarsaparilla* is advisable, even when no active symptoms of disease appear. Persons afflicted with the following complaints generally find immediate relief, and, at length, cure, by the use of this *SARSAPARILLA: St. Anthony's Fire, Rose or Erysipelas, Tetter, Salt Rheum, Scald Head, Ringworm, Sore Eyes, Sore Ears*, and other eruptions or visible forms of *Scrofulous* disease. Also in the more concealed forms, as *Dyspepsia, Dropsy, Heart Disease, Fits, Epilepsy, Neuralgia*, and the various *Ulcerous* affections of the muscular and nervous systems.

Syphilis or *Venereal* and *Mercurial Diseases* are cured by it, though a long time is required for subduing these obstinate maladies by any medicine. But long continued use of this medicine will cure the complaint. *Leucorrhœa* or *Whites, Uterine Ulcerations*, and *Female Diseases*, are commonly soon relieved and ultimately cured by its purifying and invigorating effect. Minute Directions for each case are found in our Almanac, supplied gratis. *Rheumatism* and *Gout*, when caused by accumulations of extraneous matters in the blood, yield quickly to it, as also *Liver Complaints, Torpidity, Congestion* or *Inflammation* of the *Liver*, and *Jaundice*, when arising, as they often do, from the rankling poisons in the blood. This *SARSAPARILLA* is a great restorer for the strength and vigor of the system. Those who are *Languid* and *Listless, Despondent, Sleepless*, and troubled with *Nervous Apprehensions or Fears*, or any of the affections symptomatic of *Weakness*, will find immediate relief and convincing evidence of its restorative power upon trial.

SUTRO TUNNEL COMPANY.

CAPITAL STOCK, - - - $12,000,000.

DIVIDED INTO 1,200,000 SHARES OF

TEN DOLLARS EACH,

FULL PAID STOCK.

OFFICERS OF THE COMPANY.

President........SAMUEL MERRITT.
Vice-President........MICHAEL REESE.
Treasurer........J. SELIGMAN & CO.
Secretary and General Agent........W. K. VAN ALEN.

BOARD OF TRUSTEES—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in, all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast.

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

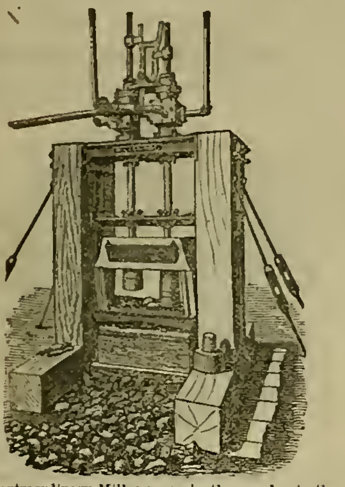
THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

☞The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

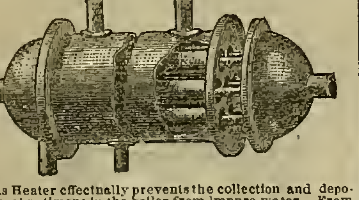
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

Crandall's Patent Spring Bed.

Manufactory, corner Front and M streets, Sacramento COOLEY, HENRY & CO., Proprietors. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. ☞ Orders received at our manufactory, or at our agency in San Francisco. 7v20-3m

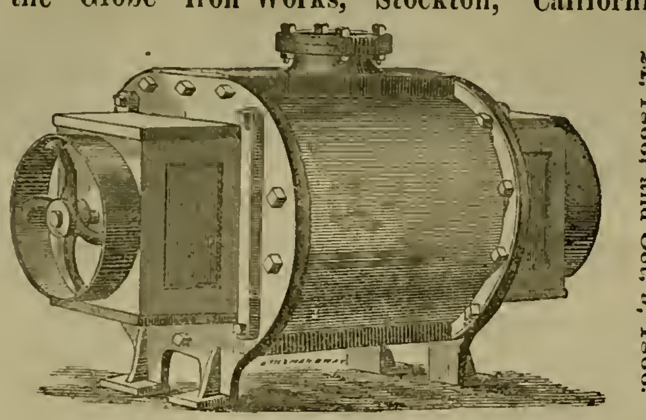
---

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

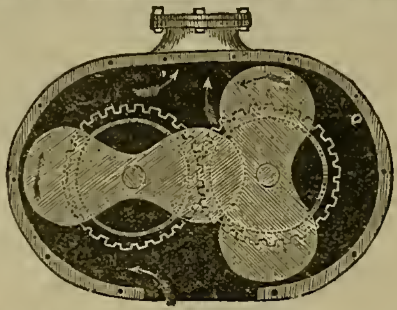
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866 and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

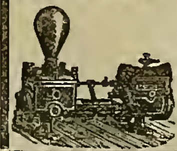
This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont street,
1v1 San Francisco.

Blake's Patent.



THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam PUMP

It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular.

SAPOINE
FRAGRANT SAPOINE FOR THE TEETH

THE GREAT MEDICAL DISCOVERY!

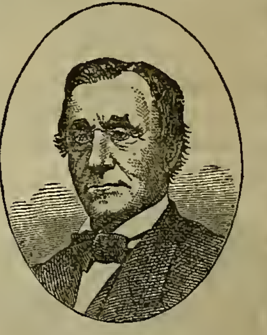
Dr. J. Walker's California

VINEGAR BITTERS.

More than 500,000 Persons

Bear testimony to their wonderful Curative Effects.

WHAT ARE THEY!



They are not a vile

FANCY DRINK,

FOR FEMALE COMPLAINTS, whether in young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient. PIN, TAPE, and other WORMS, lurking in the system of so many thousands, are effectually destroyed and removed. ☞ Send for a Circular. ☜

Made of Poor Rum, Whiskey, Proof Spirits, and Refuse Liquor, doctored, spiced, and sweetened to please the taste, called "Tonics," "Appetizers," "Restorers," etc., that lead the tippler on to drunkenness and ruin, but are a true Medicine, made from the native roots and herbs of California, free from all alcoholic stimulants. They are the GREAT BLOOD-PURIFIER and LIFE-GIVING PRINCIPLE, a perfect Renovator and Invigorator of the System, carrying off all poisonous matter, and restoring the blood to a healthy condition. No person can take these Bitters according to directions and remain long unwell.

They are a gentle Purgative as well as a Tonic, possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In Bilious, Remittent and Intermittent Fevers, these Bitters have no equal. For full directions, read carefully the circular around each bottle, printed in four languages—English, German, French and Spanish.

One Hundred Dollars will be given for an incurable case, provided the bones are not destroyed by mineral poisons or other means, and the vital organs wasted beyond the point of repair.

For Inflammatory and Chronic Rheumatism, and Gout, Dyspepsia or Indigestion, Bilious, Remittent and Intermittent Fevers, Diseases of the Blood, Liver, Kidneys and Bladder, these Bitters have been most successful. Such Diseases are caused by Vitiated Blood, which is generally produced by derangement of the Digestive Organs.

Cleanse the Vitiated Blood whenever you find its impurities bursting through the skin in Pimples, Eruptions or Sores; cleanse it when you find it obstructed and sluggish in the veins; cleanse it, when it is foul, and your feelings will tell you when. Keep the Blood pure and the health of the system will follow.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,
18v18-9p **519** Front street, San Francisco

Scientific Press.—Dewey & Co. are the publishers of this sterling paper. It is devoted to the dissemination of mining, farming and scientific knowledge, besides containing miscellany of interest.—*Monterey Republican,*

SCIENTIFIC PRESS.

An Illustrated Journal of Scientific and Industrial Progress,

Mining, Farming and Mechanic Arts.

BY DEWEY & CO.,
Patent Solicitors.

San Francisco, Saturday, April 2, 1870.

VOLUME XX.
Number 14.

DOUBLE SHEET—24 PAGES.

Our Progress.

We issue, to-day, eight pages extra made up of both reading and advertising matter. This arrangement enlarges this number of our paper to TWENTY-FOUR PAGES—making it the largest sheet yet issued in the United States devoted to Scientific, Mechanic and Industrial Interests.

With this number, we commence the second quarter since the change in our title. We promised on the first of January last, that we would not curtail the Mining Department of the paper, and would increase the reading on agriculture and other industrial subjects. This pledge we have carried out with such good results that our circulation has been increased nearly 1,000 copies within the past few months. We have heard no complaint from any quarter in regard to the timely change in our columns; but are told by subscribers in mining localities that the paper is now better appreciated in the mountain districts than ever before.

Although dull times still linger in our community, we find that the columns of our weekly issue apportioned to advertising are crowded to the utmost, and, being determined not to lessen the space devoted to reading, we have adopted the expedient of issuing a double sheet on the first week of the month to accommodate our advertising, and give STILL MORE READING.

Readers of this number, who are not already subscribers, are reminded that our subscription terms have been reduced to $4 per annum, and that the present is the very best time to subscribe.

◆

CHINA MAIL LINE.—It would appear that at last we are to make a struggle for the existence of our steam marine, as the Postal Committee of the United States agreed to report in favor of a subsidy of $1,000,000 per annum to the Pacific Mail Steamship Company, in support of its steam service between San Francisco, Japan and China. Without subsidy our lines cannot, of course, contend with the heavily subsidized English companies.

◆

BRIDGE-BURNING.—On the night of the 23d inst., some villains set fire to the bridge over the American river, on the Central Pacific Railroad, some three miles from Sacramento. The structure was very substantially built and cost some $80,000. It is a total loss. The energetic management immediately set to work on a temporary bridge, which was ready for the passage of the trains on the afternoon of the 27th.

◆

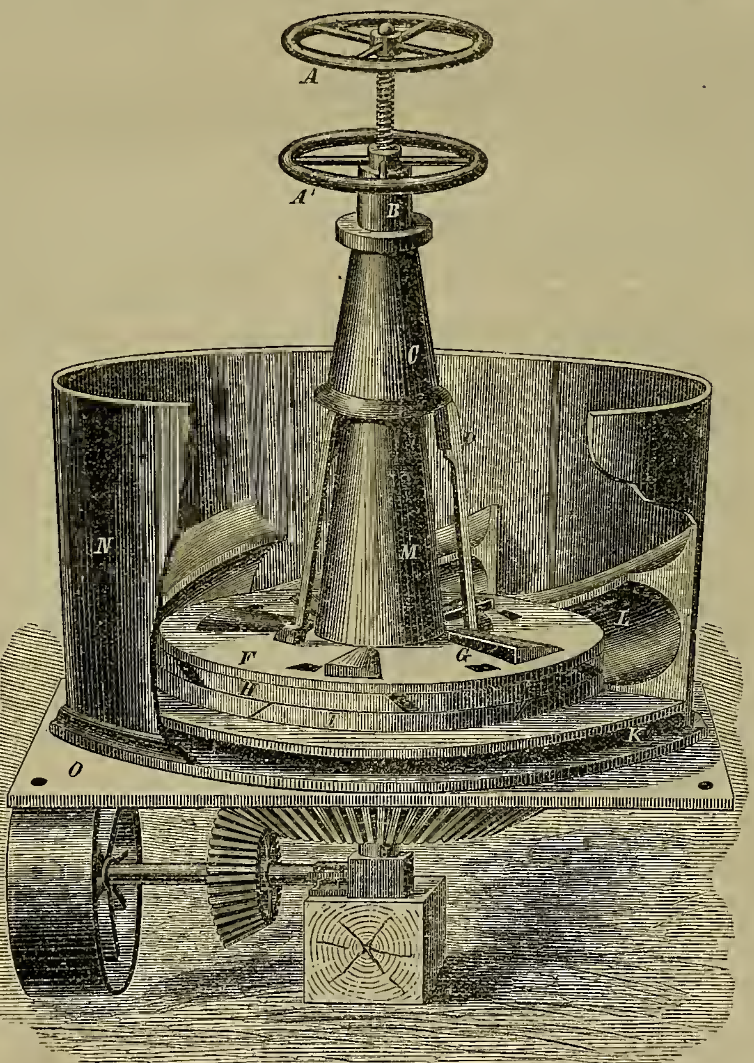
FIRST THROUGH CARS FROM THE EAST.—Last week the steamer Oakland landed at the wharf of the Western Pacific Railroad, in this city, three cars loaded with scrap-iron, the first case where goods over the Pacific Railroad have been landed here without breaking bulk.

◆

THE Senate has passed a fence law for El Dorado.

A New Amalgamating Pan.

The pan-amalgamator may justly be called an American invention, and its history from the first simple forms, working a comparatively small amount, to the large ones now in use, is an interesting topic for millmen. We could willingly trace the various changes in form and construction as they were made, were it not that we should be repeating what has been already treated of quite copiously, and that we have not at present space enough in which to do justice to the topic. Our object now is to call attention to a new modification which has recently been invented by one who has had long experience in working ores, and whose standing among millmen is such as to justify an examination of his device.



STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

The object of this construction is principally to secure a nearly level surface of pulp with rapid motion of the mullers, and to present the least possible resistance to the motion of the pulp, while at the same time the whole mass is effectually subjected to a thorough grinding and amalgamating process, and, by constantly lifting it, to prevent too heavy a pressure on the mullers, thus allowing of the working of large amounts. To secure these objects, a series of inclined wings or guides are constructed of such form that the pulp, as it escapes from the muller on the outside, will be carried up these inclined planes, thus meeting with the minimum resistance from the sides of the pan, and being started on its return to the center above the muller with the least expenditure of power; moreover, a series of curved openings or housings are provided on the upper surface of the muller at its inner periphery, by which the current of pulp is forced beneath the muller at that point, so that the whole receives a thorough and perfect grinding.

The muller, F, is constructed with shoes, and operated in the ordinary manner, as shown in the illustration. Around its inner periphery, on the upper surface, are raised plates, placed at an angle so that they cover the openings, G. As they revolve, they take in the pulp and force it through the openings, so that every portion is subjected to the action of the muller.

Around the side of the pan are placed the curved grooved guides, L, shaped like the mold-board of a plow, and formed in sections so that they can easily be replaced. The surface presented to the pulp is so grooved that the mass coming from beneath the muller, as it meets it, glides up the curve with very little resistance, and is led up and towards the center of the pan to be again passed under the muller. By this construction, no mercury is allowed to settle in the bottom, and thus be without effect on the mass, but is continually carried up the inclines and poured off into the pulp below. The other parts of the pan require no particular description. This apparatus has been running, in competition with others, at the Douglas mill at Gold Hill, Nevada, for the past eight months, and for five of these has been working ore from the Overman mine, and to the Overman Company is referred anyone desirous of ascertaining how they are satisfied with its working. The average return for the five months was 76½ per cent. of the assay value, and for the month of February, 85 per cent. The loss of quicksilver was very small, being for these same five months only forty-nine one-hundredths of a pound per ton of ore worked. This mercury, it is claimed, is not ground up to a slime, for the opening in the muller takes the sand under the shoes, so that at no time does the iron of the shoe and die come so close as to cut it up—and, moreover, it is most thoroughly and effectively used. In short, the special advantages claimed, are: economy of quicksilver and of power, higher percentage of bullion obtained, and the possibility of working more pulp in the same sized pan.

The objection of some that the grinding surface of the pan is too much lessened by the construction of the mold-boards, is answered by the fact that these mold-boards turn the pulp much oftener under the muller, while, as the shoes reach only about two-thirds of the radius of the pan, power is saved, and, consequently, the pan will grind its charge of four thousand pounds just as soon as an ordinary pan of the same size, and with one-half the power. This was shown, we are told, by the competitive trials. Another advantage is, that the mold-boards take all the wear from the pans, and being cast in sections, they can be replaced at pleasure.

This pan is manufactured at the Golden State Iron Works, No. 19 First street, San Francisco, where it can be examined and further particulars be learned; or persons may apply to the inventor, Mr. C. C. Stevenson, at the Douglas mill, Gold Hill, Nevada, who has received a patent for his improvement.

◆

THE ROCKY MOUNTAIN COAL CO. is taking practical measures for the introduction of their coal, and several tons are to be tested at the Hale & Norcross hoisting works at Virginia City.

Communications.

Mills and Mines of Colorado.—No. IX.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

As I pay more attention to the new features of Colorado than to those more familiar to miners, I must not pass by the Haskin & Grove mill, although I am so directly associated with it as to make a heavy strain on my modesty. This mill is more particularly noted as having been built for

Paul's Dry Amalgamating Electric Process,

Which is a new feature in the manipulation of ores, and as such I will be sufficiently minute to give some idea of it. The ore is first dried and then crushed as fine as it is possible to set the Dodge crusher, which is used instead of stamps, and answers the purpose very well; still I must say, as reducers to a given fineness, I have not got stamps altogether out of my head, although I would very much like to dispense with them. From the Dodge crusher the ore passes into a stave pulverizing barrel, where three-ounce iron balls are used. Here the ore is more minutely reduced until it will pass through No. 90 wire cloth.

These *stave* pulverizing barrels are peculiar to Colorado; at least I have not seen any in California or Nevada, and it is one of the institutions wherein I think Colorado is ahead. This pulverizing of ore, dry, in cylinders, however, is no new thing in California, and my opinion is, they would be better off if they would give more attention to barrel pulverizing than they do. After the ore is reduced to the fineness desired, it passes into

Paul's Preparing Barrel,

Where the ore is chemicalized and prepared for the mercury. The preparation is done under heat, which, at the same time, expels all atmospheric dampness, and puts the ore into an electrical condition. This preparing cylinder is encased so as to prevent the escape of any dust, that being delivered into a dust apartment, while the smoke from fire is led off by flues. The ore being prepared for mercury, it is changed to

The Amalgamating Barrel,

Where is now added 25 per cent. (in weight) of mercury. The barrel revolves at the rate of twenty-five revolutions per minute, and two hours are given for amalgamation, when the mass of ore and mercury are so closely blended as to make the mercury almost imperceptible to the naked eye.

The ore from the amalgamating cylinder is now discharged into a large settler, made of wood, and, with the exception of the mullers, of ordinary construction. Here the body of the mercury is precipitated, in water, and three-fourths of it, with the metal it may carry, can be drawn off in fifteen minutes after the ore is discharged. The finer portion is now discharged into

An Electric Settler,

And the mercury and metal contained therein precipitated by electricity, upon the principle of electro-plating, excepting that there is no adherence of metal or mercury, which is easily drawn off. The residue is then allowed to run of as wastage, or can be concentrated if very rebellious ores are being treated.

The system is simple, cheap and efficient. The barrel used for amalgamating works 500 pounds at a time. The gold in this locality is extremely fine, and has baffled about all the systems employed to save it; but this one of locking dry-heated ore and mercury up together, and setting all a whirling together, rather masters it. All the tests of gold ore, of which many tons have now been worked, show that the system has all the merits I have claimed for it on this ore, though so heavily sulphuretted, as well as it has worked elsewhere.

The ores of this locality, as well as about Central City and vicinity, contain much base metal, such as copper, lead, antimony and zinc, but more especially copper, which fouls the mercury, and renders amalgamation imperfect, besides getting into the bullion and reducing its fineness. By this system, all base metals are placed in antagonism, and are not taken up in amalgamation, neither do they interfere with the pure condition of the mercury.

In the alchemistic days they had what was termed

Philosophical Mercury,

Mercury which had an affinity only for the precious metals, and which has been by moderns considered a myth. It turns out, however, to be true, as I can clearly demonstrate that there is such a thing as this, and also the working ores in iron containing lead, copper, zinc, antimony or iron, and producing bullion as high as 980 fine, and no lower than 950;—in other words, the mercury has an affinity for the precious metals only, and rejects the base.

To get back to the Haskin & Grove mill, I would say their tests have been so satisfactory that they propose enlarging their capacity on the same principle, and, of course, I wish them all the good luck possible for their enterprise in introducing a California-Nevadian to help them out in conquering these terribly rebellious ores.

The Ore in Empire District

Carries a good percentage of gold, and there is no reason why, with industry, it cannot be made one of the most prosperous districts of Colorado. The ore wants fine reduction, because the gold is as fine as flour itself. It then wants care in manipulation to secure it. This stamping-down system, under a head of water, is simply pounding up the mountains to elevate the plains.

I leave to-morrow for Central City and its surroundings, and after a look over this section, will start for the balmy atmosphere of California. To-day it is 20° below zero (March 14th), and I tell you it makes one wish for a snuff of the flowers now blooming in "Frisco."

◆

Petroleum in the Caucasus.—One of the most remarkable deposits of petroleum known, exists in the region of the Caucasus. On the east coast of the Caspian Sea there are no less than 20,000 petroleum wells. Although they have been known for generations, it is only within the last few years that they have been worked upon a large scale. They are generally of a slight depth, and are frequently found beside each other.

A new source was recently discovered beside an old one, which for centuries has daily produced 3,400 pounds of petroleum, and which is not in the slightest degree affected by the vicinity of the new source, which daily produces 40,000 pounds.

The American system has lately been applied to them; the sources rising from a depth of 250 feet, frequently overflow their orifice, and ascend above them in great jets over the height of 50 to 65 feet.

It is calculated that the district of the Caucasus yields annually 19,000,000 pounds of petroleum, and 200,000 pounds of paraffine of asphalt.

◆

Bitumen and Coal in Texas.—A. R. Roesler, Geologist of the U. S. General Land Office, writes to the N. Y. *Engineering and Mining Journal* of specimens received of genuine bitumen found in large quantities on the Texan shore of the Gulf of Mexico; also of numerous specimens of true coal, including the bituminous and anthracite varieties from Young county. The deposits of coal belong to the carboniferous formation, and their extent throughout the State reaches to 600 square miles, and has an estimated thickness of 300 feet. The Memphis and El Paso road can obtain abundant supplies from these deposits.

◆

The ceiling of the new opera house in Paris is to be composed of copper plates screwed together, so as to be easily taken apart or put together, and so that the ceiling can thus be raised or lowered at will. The whole is divided into sections, which are painted with allegorical representations of the house. More than one hundred figures are said to be included in the design.

◆

Determining the Age of Wine by the Spectrum Microscope.—The result of Sorby's application of the spectrum microscope to ascertain the age of wines, has been that he considers it quite possible, up to six years, to determine the age to within a single year. After about six years the difference is so small that it would be almost impossible to determine.

From Idaho—Men Wanted.

[Written for the Scientific Press.]

Editors Press:—A few weeks since your correspondent stated that this summer the demand would be for brick-masons. Now then, we add further, that there will be an active demand for good, true, working men of *all kinds*. We want men who will work, and not lazy, drunken loafers who will stand in the sun in winter and lounge around shady ice-water fountains in summer.

Mining Operations.

This Territory is thoroughly entitled to the name she bears, "The Gem of the Mountains." Above Salmon Falls Ferry are a party of men who have been mining on the bar on Snake river all winter and making good wages. These men started from Lewiston and traveled up Snake river, prospecting the bars and gulches as they went along and finding good prospects all the way, and at last fixed on the placer which they now work steadily. Another party of miners lately passed near here on their way to the same place to join in getting out "oro." Some Mexicans in the hills a few miles north of this city have been prospecting and carrying gravel from the hills to water. They get about thirty-seven cents to the flour-sack of dirt. The prospects of the mines on the Boise, about thirty to forty-five miles above here, are better and better, and every prospector finds greater assurance of the extent of the gold region along the banks and high bars of the river. These places have hitherto been ignored because it cost too much to live and clothe oneself, but now prices are down. Flour, $6 per 100 pounds, coin; bacon, 35 cents per pound, coin; sugar, 25 cents per pound, currency; coffee, 40 cents per pound, currency; salt, 10 cents per pound, currency; dried fruit, 20 to 30 cents per pound, currency; miners' boots, $4 to $6, currency; pants, $4 to $10, currency; gray overshirts, $1.50 currency, and other things in proportion, and much cheaper in any quantity. The "diggings" above referred to are called $4 to $8 per day diggings, and those on Snake river can be worked about all the year, and those on the Boise between ten and eleven months in the year. Yet it is not for mining alone that we invite immigration to our beautiful Territory.

Agriculture.

Ader county has as fine agricultural lands as can be found, and not a quarter of them has been taken up yet. Thousands of acres are asking, as it were, for the *good* farmer to take hold and farm them, and what we want are men who know how to take advantage of everything, not afraid to spend their time and money on their farms, but determined to come and make this their home.

I could name several who sold out a year since and left, who have returned and would willingly pay a large bonus. In some cases $1,000, coin, has been offered thus for the old farm, but it cannot be got back; and others who left and have gone to California, some to Puget Sound, and not a few to the East, wrote to their friends here, regretting the step they took, and wishing it were in their power to come back here; saying, moreover, that they will if ever they can. I send you a copy of the "Capital Chronicle," the paper having the largest circulation of any Territorial paper, for Idaho items.

Geographical Ignorance.

You people in California have not much better ideas of the topography of Idaho than our Eastern friends, who speak of the Shoshone Falls being in California, and of persons going to Grass Valley, Cal.; as probably coming to Boise City, the places being near together. I saw a letter addressed to a man, "Boise City, Idaho, Oregon, California." That fellow was bound to get it right some way; but in these enlightened days such ignorance is without excuse.

Farming.

Farmers have been plowing about three weeks steadily and many were breaking ground in January. Some seed has already been sown, and agriculturists are generally at work. Large quantities of fruit and shade trees are being set out around our town. Farmers are forming local clubs in different places, and live hedges instead of fencing is now the all-engrossing theme of discussion. Osage thorn is preferred by some, and those who have tried it in the last two or three years report very favorably; the only present objection is that neither seed nor plants are for sale in the country, and they ought to be in the ground within the next month. Lumber fencing is too expensive, and rails are getting scarce and do not last long any way, as cottonwood is the only timber handy for fencing.

Adahoi.

Boise City, March 14, 1870.

The Pennsylvania Oil Region.

Tidioute, Pleasantville, Shamburg and Oil City are the four principal oil centers now, though there are a great many farms and isolated localities in which oil is produced. Tidioute has been from the first a steady and reliable point. Dennis Run is a ravine 450 feet deep, and wide enough at the bottom for a wagon road. The daily production of Dennis Run is now 300 barrels, a barrel being forty-two gallons. The wells at the bottom of the run have to be drilled from 150 to 200 feet deep before reaching the "third sand," as it is called, in which the oil is found. As you ascend the bluff they must be proportionately deeper, so that those on top are very nearly 700 feet down.

The rock in which the oil is found is a coarse, gray sand, or gravel. The coarser it is the better, for then it is said to be loose, because the oil freely percolates through it into the slender well, while it is said to be "tight" if too fine, and you have to labor hard for a modicum of oil. The wells are usually five and a quarter inches in diameter, and are drilled by the same machinery, pretty much, that afterwards pumps the well; that is to say, the walking-beam and engine. The drill consists of four parts—the bit which drills the earth and rock, the drilling-rod and a pair of jars. A rope cable, from what is called the "bull-wheel," is allowed to pay out as the drills descend into the ground, and as long as cables can be made, so long deep wells can be drilled. The cost of putting down a well with first class machinery and casing is about $4,000; but should the hole prove a dry one, as they say, when they have drilled the usual depth without finding the third sand, the machinery can be moved to another place, but they will have spent $1,000 or $15,000. With no mishaps, it takes two months to put down a well.—*Springfield Republican.*

◆

Big Prospecting Party.—In Montana they are proposing, according to reports, to prospect the land in force and to clean out any savages which may come in the way. These Indians have had it all their own way for a long time, and have rendered the country too hot for miners. The Bozeman city *Pick and Plow* thinks the expedition can be cotten up on a large scale: It is now proposed to do this. We will try and send out about 300 men from Bozeman in April, in two divisions—150 to the southward, and 150 to go directly east; then, about the same time, from 500 to 1,000, divided into bodies of not less than 100, will start northward from Cheyenne, and other points of the railroad. Thus by the middle or latter part of May, we would have from 1,000 to 1,500 men prospecting, in easy communication with each other, and the savages could be held in check. This is the only plan by which the rich undeveloped mines of Eastern Montana and Northern Wyoming can be made immediately available; and its adoption may now be considered as a fixed fact.

◆

The Liverpool copper market, according to the March report of Messrs. J. Lewis & Son, is rather dull. The amount of stocks is estimated at 18,673 tons for Liverpool and Swansea, and the supply is still greater than the demand. For ore the last quotations (March 1st) were $3.27 per unit. Tin has improved a little. Quicksilver is difficult to obtain at $34.75 per 75 pound flask. Antimony regulus is quoted at $325 per ton, and California manganese at $11¼ for 70 per cent., while good quality sells at $20 per ton.

◆

Cost of Thirteen Years' War.—M. Leray-Bennean, a "peace" man, argues that all the wars between 1853 and 1866 might have been avoided, and estimates their expense at $9,566,000,000. The number of men killed he gives as 1,743,491.

Mechanical Progress.

Hints to Boiler Makers and Boiler Users.

We cull the following from the January report of the Hartford Boiler Inspection Co.: "We frequently find boilers without hand-holes. This is a great oversight. Several cases have come under notice where the fire-box sheets were badly burned by collection of sediment in the water legs, no hand-holes being provided by which this could be removed. Again, we not unfrequently find boilers set in angles of the building, where if they are furnished with hand-holes, they are inaccessible from the boilers being set so near the wall. In the construction and setting of boilers every facility should be given to make the removing sediment free from trouble.

Steam gages are frequently found incorrect. This can only be detected by making frequent examinations and comparing them with a test gage. The attention of an inspector was recently called to a steam gage that had not varied in its indications for a month; it was found that a stop cock was turned so as to shut the steam entirely off from the gage. In another instance, where the steam gage was not working, it was found that the steam gage pipe entered the boiler through the head, and then turned a right angle, descending perpendicularly below the water line; the pipe was filled with sediment at the lower end, hence the gage was useless.

Raise the safety valve slightly and carefully, allowing it to return to its seat easily and without concussion. This should be done daily at least. See that the steam gage is in working order, and if for any reason it is thought to be incorrect in its indications, have it attended to at once. Keep the gage cock clean and bright, no-allowing them to become foul and in, crusted, and if provided with a water gaget see that it is in working order."

The New Process of Platinizing Mirrors.—C. Widemann thus describes the manner in which this is done: One hundred grammes carefully laminated platina in very thin sheets, soaped in order to remove all grease, is dissolved in aqua-regia, composed of 400 grammes nitric acid for 1,000 grammes pure hydrochloric acid. It is heated by means of a sand bath to dryness, care being taken not to decompose the chloride by excessive heat. It is then crushed in a porcelain or glass mortar, and laid on a grinding glass plate, where it is mixed with small quantities at a time of essence of lavender (rectified) care being taken not to work at too high temperature or the reaction would take place on this glass plate. About 1,400 grammes of essence of lavender having been thus added the mixture is collected in a porcelain dish and left to itself for eight days without disturbance. The liquid is next decanted, filtered and left again for six days, and must then be about 5° at the acid test Baumé. For the above quantity, 25 grammes litharge and 25 grammes harate of lead, ground to an impalpable powder, with 8 to 10 grammes essence of lavender, is then added and stirred with the platinizing liquid. It is then applied with a brush to the plate in a vertical position. After partial drying, the plate is placed in a cast iron frame with others, and baked in an oven.

New Form of Steam Engine.—A recently patented English invention may be thus described: In a disk or wheel, mounted on a hollow fixed shaft or axis, are cylindrical chambers, in which weighed pistons work steam tight. The chambers are placed in a line with each other on opposite sides of the shaft, and the pistons opposite each other are connected together in pairs by connecting-rods. In the hollow shaft openings are formed to conduct the steam to and away from other openings in the disk communicating with the chambers, so that the steam may be alternately admitted to and conducted away from them, and in doing so move the pistons in pairs, so that one of each pair may be moved outwards towards the periphery of the disk, and the other inwards towards the axis, whereby the pistons are caused to give rotary motion to the disk.

Boat Towing By Means of a Fixed Wire Rope.

The London *Artisan* describes and illustrates a method of river and canal navigation which is coming into use in Belgium and Holland. We quote a single paragraph, which gives an idea of the arrangement: "Under all the circumstances of navigation, and especially under those usually met with on rivers and canals, a dead pull from a fixed point must be a more effective mode of applying power than any depending upon the resistance of the water as the fulcrum against which the propelling power is exerted; and this principle has been adopted for towing boats by means of a fixed wire rope and clip drum. The wire rope is laid in the bed of the canal or river from end to end, being anchored only at its two extremities; and an engine fixed upon the tug takes hold of the rope by means of a clip drum, round which the rope is passed. The clip drum being put in motion by the engine winds itself along the rope, lifting it up from the bottom of the canal in front of the tug, and dropping it again into the water behind. The engine thus exerts a direct pull upon the rope, which in consequence of its weight and the friction upon the bed of the canal does not materially alter its position. By this means the whole of the power applied to the clip drum is utilized in the propulsion of the boat, independent of the currents of the water or the section of the channel."

Estimating the Power of Motors.—The *Scientific American* illustrates a dynamometer invented by James Emerson, of Lowell. A pulley, loose upon a shaft, is made to revolve with it by levers connecting its rim to a "spider" which is keyed to the shaft. These levers are connected with a pendulum on a graduated arc. We quote: The apparatus "demonstrates that little reliance can be placed in the common methods of estimating the amount of power used. We are informed that in one place, where it was claimed that but four-horse power was used, the dynamometer gave sixteen. Examination proved that one-half was wasted by bad arrangements. In another case, 231-horse power was claimed; the dynamometer gave 145, and it was found upon examination that the head of water had been estimated from the bottom of the 'pit' to the surface of water in the flume, and that the wheel was clogged with sticks and leaves, which were removed; then the dynamometer gave 190-horse power."

The Pedespeed.—This is the latest fancy in the way of appliances for locomotion. It looks like a cross between the velocipede and the parlor skate. It consists of a pair of wheels 14 inches in diameter, one of which is fastened to each foot of the performer by means of a stirrup-like appendage just below the axis of the wheel. Firmness is secured by an upright from this foot-piece reaching to, and clasping, the leg just above the calf. The *Scientific American* gives a cut of it. It is, we imagine, destined to even a shorter-lived popularity than the velocipede.

Building Stone Containing Lime.—A correspondent of the London *Builder* has experimented upon bath-stone with a solution of oxalic acid, so as to obtain a surface of oxalate of calcium, in place of the carbonate, which is friable. The result is so far most satisfactory. He has soaked for hours in water the nearly insoluble surface thus obtained without injury. He sees here a valuable hint in reference to the rendering building stone indestructible.

Slaking Lime.—The best way is to grind it fine first. A French engineer estimates the loss incurred in slaking it in lumps at twenty-five per cent. Besides this saving of material, it is found that lime in powder is spread with greater facility, and the mortar thus made sets quicker, and is more solid.

Scientific Progress.

Transmission of Electric Signals.

C. S. Lyman gives in *Siliman's Journal* for March a notice of Dr. Gould's report on the Trans-Atlantic Longitude. He closes this notice with the following remarks upon the inferences to be drawn from the experiments, in reference to the transmission of telegraphic signals: "From these results the inferences seem warrantable, 1st, that the velocity of transmission is greater when the circuit is direct and consists of a good metallic conductor exclusively, than when the signals are given by induction, although the earth may be at the other electrode; and 2d, that an increase of intensity in the electromotive force is attended by an increase in the velocity of propagation of the signal.

From the observations for longitude, and from other experiments made with special reference to particular points, the following general conclusions were reached:

'It appears manifest that not an electrical charge or discharge, but simply an electrical disturbance, is requisite for transmitting a signal; that an inductive impulse, sufficient to deflect the galvanometers employed, was transmitted through one cable, having at each end a condenser with ten cells, in somewhat less than the third of a second, five seconds after the transmission of an impulse of the opposite sort; that with a circuit formed by the two cables, a smaller electromotive force sufficed to transmit the signals with yet greater rapidity; that the signals traveled more rapidly through a cable which had not recovered its electrical equilibrium after a current of opposite character; and that the speed of the signals is modified by the earth-connections, more readily than by changes in the battery-power. And the very marked differences, found in the rates of transmission, between signals given by completing an interrupted circuit and those given by interrupting a closed circuit, may perhaps lead to investigations which will afford an explanation."

Color of the Water of Lake Leman.

The beautiful blue color which the water of Lake Leman, Geneva, Switzerland, was said by Sir. H. Davy to be "doubtless due to some compound of iodine." Dr. A. A. Hayes, Massachusetts State Assayer, gives an account in *Silliman's Journal* of some careful analyses of this water made by him. We quote: "A large volume of the water was mixed with a small portion of a diluted solution of sub-acetate of lead quickly and uniformly diffused. Another portion was treated in the same way, with a water solution of pure soap—both precipitates slowly formed, were collected in a moist state, subsequently examined by the microscope, and were found to contain only the ordinary constituents of 'white' waters (colorless waters, containing lime salts in solution) when so treated. The negative results of these trials were sufficient to prove the absence of all coloring or colored bodies. Chemical analysis, thus conducted, having thrown no light on the cause of color in this water, we are led too ascribe the origin of its peculiar tint to natural influences; namely: the reflection and refraction of an azure sky in a colorless water."

The Zodiacal Light and Terrestrial Magnetism.—Balfour Stewart, F. R. A. S., sometime since suggested that auroral displays may be secondary currents due to small but rapid changes in the magnetism of the earth. He now adds that the *zodiacal light* may also be somehow connected with the phenomena of terrestrial magnetism. He says: "For not only will secondary currents be caused in a stationary conductor in presence of a magnetic core of variable power, but also in a conductor moving across the lines of force of a constant magnet. The question arises, have we on the earth such moving conductors? In answer to this, let us reflect what takes place at the equator. When once the anti-trades have reached the upper regions of the atmosphere, they will become conductors from their tenuity; and as they pass rapidly over the lines of the earth's magnetic force we may expect them to be the vehicles of an electric current, and possibly to be lit up as attenuated gases are when they conduct electricity. May not these form the zodiacal light?"

Proof that Ammonium Exists in Ammoniacal Amalgam.

Dr. Albert Gallatin, of New York, has proved, for the first time, that metallic ammonium actually exists in the ammoniacal amalgam. He says: "If the hydrogen escaping from the mercury together with the ammonia can be shown to be in the nascent state, it would be evidence that it had just been in chemical combination with the ammonia, in other words, that metallic ammonium (NH_4) existed in the amalgam. Some pellets of sodium were placed in contact with some particles of the transparent variety of phosphorus, wrapped in bibulous paper and plunged beneath the surface of water. A red glow was seen; and as the nascent hydrogen from the decomposing water came into contact with the phosphorus, bubbles of phosphid of hydrogen were formed. Occasionally one would flame as it came into contact with the atmosphere, placing the nature of the reaction beyond doubt. As phosphid of hydrogen cannot be formed by direct synthesis if ordinary free hydrogen be employed, this becomes a test for the presence of that gas in its nascent state. The hydrogen escaping from the ammoniacal amalgam was now tested by this process. A sodium-amalgam dipped beneath a solution of chlorid of ammonium was employed; and it became necessary to wait until the sodium was exhausted, that results might not be vitiated by the nascent hydrogen escaping from the water. At the proper time the decomposing amalgam was covered with fragments of transparent phosphorus, when many bubbles of inflamable phosphid were obtained. The hydrogen must then have been in the nascent state and just escaping from the ammonium."

Dinitronaphthylic Acid.—"This,"—says Dr. H. C. Bolton, in a paper read on March 14th before the New York Lyceum of Natural History,—"is the rather formidable name of a new coloring matter known in Germany as Martins' yellow. Experiments with a view to obtaining colors from naphthylamine, similar to those prepared from its homologue aniline, have heretofore been only partially successful. Dr. C. A. Martins was the first to obtain satisfactory results, and in accordance with his investigations, Bayer & Co., of Barmen, now prepare the yellow dyestuff on a large scale by the following process:

A solution of nitrate of potash is added to a dilute acid solution of chloride of naphthylamine until the liquid is precipitated red by an alkali (Diazoamidonaphthol). As soon as the naphthylamine has been entirely converted into diazonaphthol a quantity of nitric acid is added, and the liquid heated to boiling. The naphthol in a nascent state is immediately transformed by the nitric acid into dinitronaphthylic acid."

The discoverer claims that it is one of the most beautiful and fixed yellow colors known; it dyes silk and wool without mordants in various shades, from lemon yellow to a deep gold color. The coloring power is very great; one kilo of the lime salt suffices to dye 200 kilos of wool deep yellow.

Effect of the Sun's Heat on a Sand-hill.—Geo. Davidson, of the Coast Survey, writes from San Buenaventura, in this State, that while engaged in determining the azimuth of the principal lines of the triangulation from that station, he found that the heat of the sun during the afternoon upon the sandy bluff on which the station is situated, had expanded it so that the level showed changes as great as 45″. This, together with the contraction in the evening, made a change of one minute and thirty seconds. Moreover, he found that in cooling, the tongue of the bluff *twisted irregularly* in azimuth as much as 18″ in three hours. All his results were vitiated by the discovery of these facts; and he was obliged to move his instruments. At one hundred yards or so from the edge of the bluff they were perfectly steady.

Non-vulcanized Rubber Tubing.—M. Jonant has made experiments which show that this is far less permeable for gases than that which is vulcanized. One of the latter lost in three days by diffusion 21 per cent. of hydrogen, and admitted 11 per cent. of air. A non-vulcanized tube, submitted to the same experiment, lost in 28 days only 22½ per cent. of hydrogen, and admitted only 5½ per cent. of atmospheric air.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Mining Items.—*Miner*, March 19th: Mt. Bullion tunnel is over 1,800 feet and going ahead at the rate of from 12 to 15 feet a week....Barnes, of the Rodgers mine, Hope Valley, has purchased the Pioneer Quartz Mill, Markleeville....Three tunnels in this county now exceed 1,800 feet each in length—Imperial, Mt. Bullion and Mountain No. 1....Slow progress has been made in the No. 3 tunnel of the M. C. Co., on the Tarshish lode, this week, the rock being hard to blast....The lower tunnel of the Schenectady Co. is getting into rock which contains sulphurets and now and then real Tarshish ore.

Pennsylvania Co. —*Chronicle*, 19th: Assessment levied of two dollars a share. The company will shortly commence active operations again. The mine looks well and a large body of good ore is in sight.

AMADOR COUNTY.

Items.—*Dispatch*, 26th: We learn that the Oneida mill took out $40,000 after a run of fifteen days....The Cony mine is advertised for sale on the 13th April. We hope it will fall into the hands of parties who will work it as it ought to be worked. It is a good mine.

Ditch Survey.—*Ledger*, 26th: The engineer on the Butte ditch extension started in yesterday. The old portion of the ditch will be enlarged, and the extension constructed to correspond. This ditch will convey water to the vicinity of Sutter creek, and will open up an extensive mining section heretofore unavailable.

EL DORADO COUNTY.

Gold Dust. — Placerville *Democrat*, March 26th: There has been shipped during the present month gold dust to the amount of $40,000.

INYO COUNTY.

A Los Angeles telegram of 29th says: Twenty-thousand pounds of base bullion from Cerro Cordo has been received, which contains 20 to 30 cents of silver to the pound.

LOS ANGELES COUNTY.

Gold.—*News*, March 19th: Upon the San Gabriel river from one to two hundred ounces are taken out each week. There is hardly a cañon between here and San Diego that "specimens" are not taken out.

A telegram of 24th says: Miners engaged in sluicing the bed of San Gabriel river continue to make handsome wages.

MARIPOSA COUNTY.

Mariposa Co.—*Gazette*, 25th: The company's mill below town, after a suspension of over two weeks, started up on Monday, and is now stamping night and day. The mills of the Co. on the Merced river have all been changed from dry to wet crushing, the last one altered starting up last Monday under the old style. This Co. has thoroughly tested both and finds that wet crushing pays best in the long run.

NEVADA COUNTY.

Mining Situation.—Grass Valley *Union*, 27th: From all parts of the county we hear the best news. The hydraulic mines are run night and day, and not a drop of water is lost. The results are satisfactory. Quartz in Grass Valley is active, though the rains have interfered with hauling rock. Ben. Macauley's stamps at Boston Ravine are idle. There are a few loads of rock on the platform of the Gold Hill mill.

Eureka.—The clean up for the last 12 days shows that the mine is in the same old way of splendid yields. The Idaho, just east and adjoining, is doing well.

Perrin's Mine.—The new openings show the ledge to be as good as ever with greater facilities in getting out rock. The mill is running a portion of the time. The cleanings of the plates show the rock to be worth $30 to $40 per ton.

Allison's Ranch.—This claim is giving out fine rock. The openings do not supply sufficient to keep the stamps running night and day.

Coe.—The mine is getting along well. The shaft is down 150 feet on the incline; the ledge is 3½ feet thick and shows well. The mill will start up about the middle of April.

Items.—The Wheal Betsy is to be worked about the first of May. Others of the idle mines are to be started up again....The Empire mine and mill, on Ophir Hill, is working full handed with good results....The North Star is yielding surplus funds, and above and below ground the situation is satisfactory....The West Eureka is constantly at work. The shaft is down 165 feet on the incline and the ledge has improved much.....The Greenhorn remains a very large ledge, from 10 to 14 feet thick. Mill process shows that the ledge is good for $20 rock on the average, with not over $6 as expenses....The Pittsburg is wanting miners.

Middle Yuba.—The Lindsey or Mariette Company have a good ledge, 14 feet thick. The company have a 10-stamp mill working good rock. The Salathael Co. is also working good rock, with a ten-stamp mill. The Fidelity Co. have a tunnel in 200 feet, have struck the ledge and are sinking an incline from the tunnel on the ledge. The ledge is eight feet thick and shows heavy sulphurets, galena and some free gold. The tunnel gives 140 feet of backs. Recently the Co. have leased a mill close by their mine.

Gravel.—Brown Brothers, on Squirrel creek, are taking out plenty of gold by hydraulic process. Webster & Co., on Randolph Hill, are still getting out good gravel. The channel is widening. James McCauley and Hans Roberts, on the Roberts & Co. claims, took out $400 in nine days, two men working. The Town Talk mine is again working in good gravel and cement.

Big Project.—*Transcript*, 23d: The Branch Mint Co. has commenced a tunnel from Wolf creek, on the Grass Valley side of the ridge, between Grass Valley and Nevada, to Gold Flat on the Nevada side. This tunnel will be over a mile in length. It will be 300 feet below the highest elevation, and run in quartz all the way. The "back-bone" of the ridge is slate, and it contains a number of good wide ledges—the same ridge on which the Pittsburg and other mines of value are located. The rock yields readily to the pick, the blasting is easy and the workmen are making rapid progress.

Sucker Flat. —Same of 24th: The leading mine is the Smartsville Consolidated Hydraulic Mining Co's claims, which, from its name, has been spoken of as being located at Smartsville. This mine has an outlet on the Yuba, and about half of the ground is located in Nevada and half in Yuba county. It is being worked on a very large scale. The banks are one hundred feet in depth, and they have the blue gravel channel. The claim may be considered as a new development as only two full runs have been made. In December, after the first run, the yield was $41,000, and the last run of 30 days gave a gross yield of $70,000.

The Blue Point claim adjoins the Consolidated. In this a bed-rock tunnel is being run, which will be 2,270 feet in length. The Blue Gravel, Pittsburg and Union claims are washing, and tunnels are being run by several of them.

Orleans.—Same of 26th: This Co., on Gold Flat, have taken out fifty tons of splendid looking quartz, which is being hauled to Stiles' mill for crushing.

Mohawk.—We understand that as soon as the difficulties are settled, the mine will start up again under the management of competent men. Last season a party offered Mr. Barber $250 per ton for ten tons, if he would open the claims ten feet below where they were worked some years ago, when the shaft was lost.

A Good Run.—*Gazette*, 23d: Cobb & Co. made a partial clean-up in their hydraulic claims at Scotch Flat, on Friday last. The yield from eleven and a half days' run was $2,376.37.

The Saulsbury Mine.—*Transcript*, 29th: From what we learn this new discovery excels anything we have ever heard of in this township. Mr. Saulsbury pounded out, in a hand mortar, over $500 in one day, and he has a large quantity of the same kind of rock. The ledge is upwards of four feet in thickness. Work on it was performed by his own hands, no living being except himself knowing the exact location of the ledge. As soon as his brother arrives, he will have it recorded and put on a force of men, and take rock out as fast as possible.

Banner.—We learn that the ledge never looked better than at present. Twenty stamps are kept running constantly, and they have increased their force to sixty men. On the first they will commence using the other stamps, making forty in all.

Scott's Flat.—All are putting in their best licks. One company made a partial clean-up last week, and after a run of eleven days and a half, took out $2,376.37.

Eureka.—A telegram of 28th says: It is melting day at the Eureka mine; $24,000 or $25,000 were realized for twelve days' run.

PLACER COUNTY.

Michigan Bluff.—*Stars and Stripes*, March 24th: The North America Co's claims are turning out handsomely, the yield for one week amounting to near 120 ounces. This claim has been worked successfully for many years.

A Rich Boulder.—Nevada *Transcript*, 26th: L. R. Anthony and W. Chesney, in their claims at Dutch Flat, known as the Jim. Taffe Hydraulic Claims, struck a boulder on Thursday, weighing 300 pounds, the value of which is estimated at from $7,000 to $8,000. The stone has not been crushed yet, and its value is estimated from the gold in sight. These claims are very rich, and an offer of $100,000 was made for them some months since.

SHASTA COUNTY.

Good Pay.—*Courier*, 26th: Last week Henry Chapman, at Janesville, cleaned up, after a run of three days, $175.

Messrs. J. Leary and E. & D. Sweeney have purchased a three-fourth interest in the Spring Creek mining ditch.

SIERRA COUNTY.

Struck Good Rock.—*Messenger*, 26th: The Dreadnaught Co. on Kenaka creek have struck the ledge in their lower tunnel. We have seen specimens which were rich in free gold and carrying sulphurets. The ledge is four feet wide. About fifteen tons have already been taken out, and crushing will be commenced as soon as sufficient rock is obtained.

Howland Flat.—We understand that the claims are generally getting into good paying ground.

TRINITY COUNTY.

Dutton Creek.—*Journal*, March 26th: There can be no great result from this section until water is conveyed to the mines. Since our last, several companies have found the rim rock, and in every case the gravel prospects well, and is the same as in the discovery claim. Eight hundred dollars have been refused for one-fourth of the Dixon, Connor & Co. claim.

Prospect.—William Barber went to work a few days ago with a rocker on a point below McGillivray's ranch, and rocked out $20 the first day.

More Prospecting.—We are informed that good prospects were obtained last week on the divide between Indian and Redding creeks. From appearances the diggings are likely to be extensive, and consist of washed gravel, similar to that of Dutton creek. Plenty of water to be had.

Trinity Bar.—Jones & Hughes have found a very rich lead in Trinity bar, a short distance up the river from Douglas.

Junction City.—Cor. of same: Ed. Harthan and John Smith started up the mountain, the other day, to find a drifting claim. Having selected a place they started in on the "rim rock" and found good-looking gravel. Harthan took a panfull to a spring and found two bits. The following day these two went to work with a rocker, and took out $13.50, having to carry the dirt in buckets twenty yards up the hill to water. Several miners are now at work prospecting the flat.

YUBA COUNTY.

Struck Gravel.—*Appeal*, 26th: Workmen on the California and Oregon Railroad have struck on the line of the road two large and valuable beds of gravel.

Arizona.

Pine Grove.—Prescott *Miner*, March 12th: Notwithstanding the great richness of the quartz of this new district, the first attempts to work it have proved failures. The men lost both the gold and the quicksilver which they put into the arastras. A new trial is to be made.

Lynx Creek.—Men were endeavoring to sluice with ten inches of water—all there was. After crushing three tons of ore, "Uncle" Billy Pointer stopped his wheel and arastra—not having sufficient water to run them. He did not think it worth while to clean up. Miners from other camps tell the same story—no water to sluice with, but enough to rock with.

Quartz Mill.—Cal. Jackson, Solomon Shoup, and other citizens of this place, have gone to work to repair and run the Eureka 10-stamp quartz mill, in Walker district.

Wickenburg.—The Vulture Co's 40-stamp mill was running. The tunnel in the White Picacho mine was in 100 feet.

Colorado.

Franklin Co.—Central City *Herald*, March 23: No work is being done in the main shaft, but from a shaft 300 feet east. The ore yields over $100 per ton. There are 200 or 300 tons of average ore at the different dumps.

Russell Gulch.—Henry Chattillon, on the Ingomar, has from three to five feet of ore similar to the Pewabic. He is crushing at Berstom's mill. Henry R. Wolcot will start up the King Co's mill on Thursday. Bradley's mill will start next week. Perrin is through the cap on the Pewabic, and is taking out a cord a day. We learn that an English Co. is about buying all the mining property in Willis gulch.

Items.—The Gilpin & Coley mine last evening deposited three silver bricks, weighing 585½, 513½, and 590 ounces—total, 1,689 ounces. Another lot is to be added this evening....Cyrus Hurd, Jr., has started his 20-stamp mill in Black Hawk, on ore from the American Flag. Clayton, besides his Nevada mill, is also running, on Nevada ore, the Holdbrook, 13 stamps, and the Mead mills, 20 stamps. Taber & Lewis are repairing the O'Conley mill, in Nevada....Ore from the Schaffter lode, 10,275 pounds, yielded 12 ounces gold....Chas. Mather's quartz mill runs night and day.

Consolidated Gregory. — A large amount of money has been expended upon the mine during the past year, and everything is now in perfect order. New ground with $236-ore has been discovered. The last month netted $2,000 over expenses, and henceforth the mine will be self-supporting.

Items.—*Register*, 24th: Charlie Morris, of Spanish Bar, has had a crew of miners at work in the Whale mine for several months, and reports that they are raising very rich ore. The company contemplate putting up two or more of Buckner's roasting cylinders, with Frieberg barrels. Their mill, one of the largest in the Territory, is run by water power....Out of 89 patents to mines, which have been issued, 33 have been received at the Central City Land Office.

Idaho.

Prospects.—Boise City *Statesman*, March 17th: The late storm furnished sufficient snow to prolong the mining season at least 30 days into the summer months, affording a more copious supply of water than since '64.

Boise River Mines.—Same of 19th: The claims of Lambing & Co., 35 miles from this city, have already been in operation, but were compelled to stop on account of the freeze. They have a ditch, reservoir and hydraulic, all in order, and a fine prospect for the season. The bars are high, the gold fine and hard to save, but sufficiently plentiful to make $20 diggings. The claims of Quivey & Co., ten miles above, are also ready to begin with spring weather.

Snake River Mines.—Same of 22d: Jackson & Co. are rocking about four miles above Shoshone Falls, and making good wages. Jamison & Co. have two rockers running six miles below the Falls, and are making an ounce per day to the hand. The camp may be summed up as follows: Five rockers are run by four companies, consisting of twelve miners, making average wages. In addition to these I might add from six to ten prospectors scattered along the river. The reports that hundreds of men are making big money are all bosh.

Items.—Idaho City *World*, 17th: The King ledge, Summit Flat, have out 100 tons of rock, which will average $60, and will soon commence crushing....The Mammoth ledge have their tunnel in 420 feet, and have struck rich rock. The ledge is two feet in width, and will probably go $100 to the ton....The Elkhorn have out 180 tons, which prospects well, and will start their mill soon.

Montana.

Silver Bow.—Cor. of *New North-West*, March 11th: Our prospects are the brightest they ever were. This will be a prosperous season. Our only want has been water, and we will have it in abundance. When spring opens there will be from 500 to 700 claims started up that will pay from $5 to $50 per day per man. Two thousand men will find remunerative employment in this vicinity this season. The Miners' and Robinson & Turner ditches, nearly completed, will throw 2,000 inches of water on ground heretofore idle.

Pilgrim Bar.—We learn that some prospectors struck from 10 to 35 cents on the upper end of Pilgrim Bar last week. They are now working to ascertain the extent of the pay streak, and have three feet of gravel. It is supposed to be the same channel now worked successfully lower down. J. H. Meyer writes that new bar diggings have been discovered up Granite gulch, one mile from Pike's Peak.

Nevada.

COPE DISTRICT.

Mountain City.—Cor. of Elko *Independent*, March 26th: The Mountain City Co. is taking out good ore. The Argenta have struck the ledge in their tunnel. The Canty mill is running day and night on ore from the Crescent. The California Co. are pushing their tunnel with dispatch.

They have already struck two ledges. The Mammoth Co. is hard at work. Considerable excitement in regard to new discoveries in Cope and Bruno—the Sultana and Cocoanut at Cope, and the famous Lost Ledge at Bruno. A ledge, called the Washington, is over four miles in length, and four to five feet wide.

Items.—A 20-stamp mill is to be erected at Mountain City as soon as the roads become good. It was brought out to Idaho by Eastern parties, but never put up.... M. Oppenheimer will erect a mill in Cope. ....Whitney and Co. shipped to San Francisco on the 21st, 50,000 pounds lead bullion.

HUMBOLDT.

Battle Mountain. — *Register*, March 26th: The mill is kept running on ore from the Little Giant mine, that pays $150 per ton, and turns out over $1,000 in bullion per day. There are six or eight mines in the district yielding ore.

Pease continues work on the Union Series, and reports the mine looking better than ever. Sacking ore from a three-foot ledge, 250 feet below the surface.

The Butte Mining Co. at Galena, realized over $1,500 clear profit on the last load of ore shipped to San Francisco. The last assay from their new location (Butte No. 2) went as high as $1,400 per ton.

Unionville—The *Silver State* of the 22d inst. says: The Pioneer mill has been running to its full capacity on Manitowoc ore. ....Owing to the condition of the roads between the Arizona mine and the mills, the working force has been reduced. The yield of this ledge for the past twelve months is roughly estimated at $500,000. Work is to be resumed on the Seminole tunnel about the first of the month. The Alpha mine is looking exceedingly well. Smith's ledge, near the Alpha, will work from $100 to $500 per ton. Frank Germain has struck the Oregon ledge in his tunnel with very flattering prospects.

Oreana.—*Register*, 19th: J. Mosheimer, Supt. and proprietor of the Smelting Works, made his first shipment of crude bullion Monday—17 bars, weighing 1,500 pounds, and valued at $6,000

REESE RIVER.

Whitlach Yankee Blade.—*Reveille*, March 23d: The party who leased this mine have had a lot of several tons reduced at the Manhattan mill. The assay of the first class gave $1,420 of silver to the ton, and that of the second class gave $322.

Silver Bend will come up again this summer.

Mineral Hill.—We learn that the miners generally were working, and that large lots of excellent ore had been taken out in anticipation of the erection of a mill.

Bullion.—Same of 26th: During the week ending this date 13,530 ounces of bullion were produced at the Manhattan mill.

WASHOE.

Gould & Curry.—Gold Hill *News*, March 26th: The mine is yielding 80 tons of ore per day, assaying on the average nearly $60. A quantity of excellent ore is found which was passed by in the early days in the search for richer ore at a greater depth.

Imperial-Empire.—The cross-cut west at the end of the south drift from the 1,100-foot level has reached the east clay of the ledge at the Holmes ground, and cut into it eight feet. A long drill hole is kept in advance of the main working, so as to tap the water gradually, giving the men time to get out of the way. The new 120-horse power engine has already reduced the water to 30 feet.

Yellow Jacket.—Yielding 300 tons per day of high and low grade ore—about equal quantities.

Ophir.—A nice little streak of red ore was found day before yesterday, in drifting west from the south shaft of the upper workings, 75 feet from the surface. It is not extensive. The water will soon be all out.

Hale & Norcross.—Yielding 177 tons of ore per day. The 175-foot level shows an increased yield. The dumps are overflowing with accumulated ore. The shaft is now 70 feet in, good ore most of the way. Receipts for February, $145,202.66.

Crown Point.—The upper workings yield 60 or 70 tons per day. Prospecting is vigorously carried on.

Chollar-Potosi.—Daily yield 160 tons; average assays, $46 per ton. The drift west from the 450-foot station of the new shaft is now in 382 feet.

Sierra Nevada.—The drift at the mill battery level has reached hard rock in place of the expected gravel deposit, and a raise will be commenced to reach the deposit above.

Overman.—Some good ore developed in running south on the 223-foot level.

Sacramento & Meredith.—Some very fine specimen ore, rich in free gold, is occasionally met with.

Belcher.—Good progress in drifting at the 730-foot level, with favorable indications. The mine yields 65 tons of fair milling ore per day, and the Rhode Island Mill is kept running upon it.

Occidental.—Assays from the ledge in the lower tunnel are ranging higher. The face of the tunnel is half in the ledge.

Virginia Consolidated.—Drift west at the 500-foot level in 172 feet from the shaft to-day; in blasting rock, which works well, and no water.

WHITE PINE.

Weekly Review.—*Empire*, March 27th: Although the storms have retarded work, yet many mines have started up, and a large amount of ore is being taken out. Several mills have been compelled to suspend for want of water, caused by the shutting down of the water works. Steps have been taken to supply nearly all with water from springs. The general prospects are highly encouraging. The base metal ledges are producing ores of a hotter character than at any former time, and for the past 20 days our furnaces have produced more bullion. There are now ready for shipment over 200 tons; and although all teams from Elko go back loaded with base bullion, that article is accumulating at the rate of fifty tons per week.

Items.—*Empire*: A large amount of ore is coming out of Aurora Consolidated, and 1,200 tons now on dumps....In Eberhardt a deep excavation is being made next to the north wall, which yields a large amount of ore—milling from $100 to $200 per ton. A tunnel is being run to strike the ledge 130 feet from the surface....N. H. Rockwell has leased the Wabash mine. The pay ore is 80 feet from the surface, and nearly horizontal. The stratum is four feet thick, and superior to anything we have ever seen outside of the old chamber of the Eberhardt. Chunks of pure chloride weighing 30 and 50 pounds were taken out. A portion of the ore is being sacked, being too rich to ship now; 300 tons of common ore is at the Sheba mill....Montauk mine has a shaft 53 feet deep, the 13 feet lowest in high-grade ore....Original Hidden Treasure is being opened in good shape.... Blackfoot No. 2 promises well...The Elko is proving one of the best of base metal ledges. For forty tons now on dumps $50 per ton has been refused. It assays $200 to $600. Three men take out 6 tons daily...A blast in the Buttercup on Thursday threw out a ton of wonderfully rich ore....Big Treasure will start up again with water from its own spring.....Van Wyck's furnace is turning out 4 tons base bullion per day.... Stanford mill shut down for want of water. ....Henderson mill still toots its whistle, having its own water to wet it.

Items.—*News*: Treasure City is picking up again. About 150 men have been put to work within ten days. Crown Point No. 8 resumes work to-day....Fine ore struck in the Derby mine....Work is to be commenced in the West Point on an extensive scale.

Capitalists Coming in.—*News*, 21st: W. J. Bevan comes as the representative of Philadelphia capitalists, two inaugurate work in mines owned by the company in this district and Eureka. Mr. B. is accompanied by an engineer and a machinist, who will proceed at once to erect to iron furnaces in Eureka, for smelting base ores. The furnaces will be at hand in a few days. Mr. Bevan brings an engine and a patent furnace for Mr. Robinson, of Eureka district, to be employed in working ore from the Buttercup mine.

San Francisco, Chicago, Philadelphia, New York, and English capital, is coming in more freely at the present time that at any previous period in the history of White Pine.

Patterson District.—*News*, 26th: J. C. Bender, of San Francisco, has been testing some of the ores, and intends to erect 5-stamp mills in both Patterson and Shoshone districts. The figures of nine working tests, 50 pounds each, are given. The lowest is $71, and the highest $274 per ton.

Robinson.—Both Chicago and San Francisco parties will commence work in this district at an early day.

Silver Park.—*Empire*, 25th: Last evening Mr. Morris brought in some ore from the Jim Bradshaw mine, of uncommon richness. Horn silver exists in it as plentifully as in the Eberhardt. The district is lively.

New Mexico.

Over the Mountain.—Cor. of *Press and Telegraph*, March 9th: The Montezuma is running 15 of its 30 stamps. The Aztec mill cleaned up, after six days' run, 287¼ ozs. gold, worth $5,400. The mill pays regularly $4,000 to $5,000 per week. Wiggins, Ritchie & Co. have a 6-foot vein, and are taking out quartz by the cord. The French boys have a 60-foot shaft, and have out 8 or 10 cords of fine-looking quartz. From the Tunnel lode of Webb & Co., a pound of quartz in which no gold was visible, yielded 32 cents—at the rate of $640 per ton.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

San Francisco, March 31, 1870.

W. T. Atwood states the following as approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 10 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	28 85	19 " "	44 55
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	82 50
16 " "	35 20	30 " "	75 00
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

Havilah, Kern county.—We have received a communication, inquiring the reason of the depression of the mining interests around this place. We would prefer that some person in that locality should answer the question. Will not some one living there write us a letter concerning the cause of the cessation of operations?

◆

The Kansas Pacific Railroad is completed 84 miles west of Sheridan, and will reach Denver, it is hoped, in early fall. A telegraph line, built in advance of the road, will be completed next month.

◆

The volcano at Hawaii gives indications of a new eruption. The crater of Kilauea has been unusually active, and earthquakes have been frequent.

◆

The Senate voted an appropriation of $100 per month for Marshall, the discoverer of gold, and $250 per month for Gen. Sutter.

◆

Railroad Veto.—Gov. Haight has vetoed, as unconstitutional, the bill to aid the construction of the San Joaquin Valley and Southern Pacific Railroad.

◆

From Virginia City comes a report of gold ore found on the west fork of Pitt river.

◆

The stealing of ores or metals from mines is to be made grand or petit larceny.

San Francisco Mining Stock Market.

The mining-share market does not quite maintain the activity noted for some weeks past; nevertheless, sales of a number of leading stocks continue free, under rather better prices than ruled early in the week, while a number of others exhibit a slight recession. The claims on the Comstock lode still give great encouragement to those whose interests are so closely identified with their successful working, and strong is the hope in the ultimate good results in the present deep explorations.

From the White Pine *News*, of March 23d, we extract the following: "The large number of mines started up during the few days of fine weather last week, attests how eager our people are to commence the Spring campaign in mining. Melville Atwood, the distinguished mining engineer employed by the English company to examine some of the leading mines on Treasure Hill, with a view to their purchase, was among us a fortnight, and has departed for San Francisco, favorably impressed with the wealth and permanency of our mines. We have not learned whether his report to his company will be given to the public or not; but we have the foreshadowing of it in expressions let fall before he left. He made a thorough examination of the Aurora South, and partial ones of the Aurora Consolidated and Hidden Treasure. His report on the former will be highly favorable, so much so, that the mine will probably change hands at an early day, for a large figure. His observations in the other mines mentioned were incidental to a thorough understanding of the geological formation of that portion of the hill on which the Aurora South is situated. He confirms the theory advanced by us last Fall, in regard to the existence of a large ore-channel or dike fissure, extending from the Hidden Treasure to the Aurora South. This, Mr. Atwood believes to be the 'mother lead' which spreads out to enormous width on the Aurora ground, trending with the hill, and passing through the Nevada and Summit. Upon his report being made, his company will doubtless open negotiations for the purchase of the latter mines from the Treasure Hill Mill and Mining Co. In fact, we believe such negotiations are now going on."

Chollar-Potosi—has been in fair request, showing some improvement. For the week closing March 25th, 1,146 tons of ore were extracted, against 1,150 tons the previous week. Some improvement is perceptible in the ore producing localities. At the south end of the Blue Wing stope they have an excellent body of ore that has all the appearance of the Belvidere deposit, and promises to give a large amount of good ore. This streak is making off into virgin ground. In the Chollar-Potosi shaft, 69 feet have been added to the west drift, making the total distance from the shaft 446 feet. On the 25th of March they sent forward $8,380 in bullion. The daily ore slip of the 28th of March shows shipment of 202½ tons of ore to four different reduction mills.

Belcher—did not sell to so large an extent as last week, but has been well maintained in price. On the 28th of March, $10,098 in bullion was sent to the office in this city. In the 730-level the ground is favorable, and the southwest drift shows a face of clay, which is a change for the better.

Kentuck—has been moderately dealt in at an advance. For the week ending March 25th, 375¾ tons of ore were extracted—the 66 per cent. assay value being $6,199 97, or $15 60 per ton. For the month of February, the bullion yield amounted to $29,300. The prospecting work is still being prosecuted in all the levels from the 400-level up, with little encouragement as to good results.

Crown Point—sold at very uniform rates during the week under review. A yield of 492¾ tons of ore is reported for the week ending March 25th, the 66 per cent. assay value showing $7,543 98, equal to $16 31 per ton. Nothing favorable has been discovered since our previous report.

Gould & Curry—sold at fluctuating rates, but still maintained the recent advance. For the week ending March 28th, 647 tons of ore were extracted, against 540 tons the previous week. The stopes continue to show as much ore as heretofore reported. The El Dorado section has been "raised on" 34 feet from the track floor, and the ore at the top appears better in quality than that found at the tunnel level. At the seventh station, the No. 2 drift, running west, is now 170 feet in length, and during the last day a marked change is said to have occurred in the material—hard rock running out, and clay coming in, with healthy looking quartz in the face of the drift. The course of the drift running north has been changed to northwest, and thirty feet run in the latter direction—the face now being in a heavy mass of clay.

Hale & Norcross—has been in moderate request at an advance. The yield of ore for the week ending March 26th, was as follows: Upper mine—175 level, 246 tons; 300 level, 79½; 535 level, 851: lower mine—fifth station level, 72 tons; sixth station, 592½, making a total of 1,025½ tons against 1,204½ tons the previous week. They have on hand at the dumps 5,933 tons, of which 2,485 tons is low grade ore. The shaft is now 68 feet in depth beyond the sixth station, and the sinking continues in the ore vein without any appearance of the west wall. Three feet of the west side of the shaft show good ore—equal to any found in the level above. On the sixth level, the ore breasts on the south continue to look well. Five of the floors on the north, from the track floor in the sixth level upward, are now within a few feet of the northern boundary. Here the vein retains its former width of twelve or fourteen feet, but is greatly mixed with porphyry and low grade ore.

Overman—has been slow of sale at a recession. For the week ending March 27th, 1,025 tons of ore were extracted; previous week, 1,018 tons. The body of ore cut on the 226 level has widened considerably in running south, and the north drift on the 600 level is in 96 feet, showing fair milling ore. In the south drift on the 600 level the cross-cut is in 41 feet, the rock becoming softer as they advance, and it is expected that by continuing a short distance eastward, they will cut the ledge.——Hidden Treasure Consolidated (W. P.) levied an assessment of 25 cents per share on the 28th of March.——Aurora Consolidated (W. P.) annual meeting of stockholders, April 10th.—*Commercial Herald*.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Planting Trees by the Highways.

An act was passed by the Legislature two years ago, designed to encourage the planting of trees on the public highways. This law allows a premium at the expiration of four years after planting, provided the trees are in a thrifty condition at that time. The object of passing such a law was a commendable one; but few, however, so far as we have learned, seem to be making any preparation to claim the bounty. In the meantime some of the counties are agitating the propriety of offering premiums from the county treasuries as a still further inducement for forest tree culture. This matter has been agitated in this form in Napa, Yolo and Solano counties. It would, no doubt, be good policy for all our valley counties to unite in a concerted movement of this kind. The value of the land so improved would be sufficiently enhanced to more than meet the small premium that would be offered by the increased assessment thereon.

The most profitable trees to plant, among those which would come within the intent of the law, would be the locust, cottonwood, elm, maple, alanthus, black walnut, and, in short, any or all of the entire list of the nut-bearing trees. Every tree, so planted, and properly cared for, would enhance not only the land in front of which it might be placed, but, to a greater or less extent, all adjoining lands. The articles we have published from time to time appear to demonstrate, quite fully, from well established facts, not heretofore properly appreciated, that trees, even in isolated patches, do exert a most important meteorological influence upon large tracts of country which surround them. There can be no possible doubt but what the farming districts of California would be vastly improved, meteorologically and otherwise, by a general and judicious cultivation of trees. We have but little doubt that all danger from excessive droughts might thereby be removed, to say nothing of the large value which the trees thus grown would have for fruit, timber and fuel.

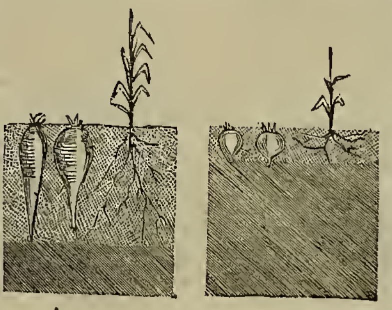
Notable Exportation.—The Montana, which left this port on Thursday of last week, took away $20,000 worth of hops *for export to Europe*. The fact is beginning to be appreciated abroad that California hops are unequalled by those raised in any other part of the world. We have no actual knowledge in the premises, but we presume the above shipment has been more or less influenced by the exhibition of California hops at the late Paris Exposition. A bale or two of hops were opened there, and freely distributed to brewers and others who were congregated there from the various countries in Europe, and who, without exception, bore united testimony to the fact alluded to above. May we not reasonably hope that this is but the beginning of a foreign trade in this product of our soil, which, in the future, will occupy no unimportant position in our list of agricultural reports?

In many of the rural districts of Germany, plows are used which in construction and shape resemble the old ones used by the ancient Romans, pictures of which can be found in illustrated editions of Virgil's Bucolics. Often one sees a cow and a woman drawing these agricultural instruments, while the able-bodied man directs the pole. But while these things seem so strange to us in this country, we must remember how different are the circumstances, and we should pity rather than ridicule those, to whom these things are a necessary condition of life. And yet they are contented, apparently.

Plowing—Deep or Shallow.

The process of plowing is acknowledged by everyone to be the most important of any operation on the farm. It lies at the very foundation of farming. With regard to the general objects sought for in this operation—the formation of a seed bed, by thoroughly loosening and pulverizing the soil—all are agreed; but the minds of men are not so completely harmonized in regard to the manner in which that work should be done. One man would plow shallow everywhere and for all crops; another would plow deep under all circumstances and for every kind of crop. The real truth of the matter lies between the two—or rather in *a mixture of both.*

There are cases where deep plowing would be highly disadvantageous; as, for instance, on a thin stratum of loam and subsoil lying upon a bed of dry sand or gravel, especially in a country like this, where the chief part of the moisture for sustaining plant life through the summer must come up from below, by capillary attraction. If the plow should cut through the subsoil, on such land, the moisture would be attracted downwards by the double force of gravitation and capillary action. There shallow plowing would be advisable. But such cases are rare. When the soil is deep, the plow may go down to the greatest practicable depth, with manifest advantage. Soils and subsoils differ so widely that we can never expect to arrive at any well-settled and uniform rule. Whenever it is practicable, however, we should advise deep plowing. On a stiff subsoil it may not be advisable to go down at once; it may be better to deepen it by degrees—plow a little deeper every year.



As a general rule, we believe that the deeper, within reasonable limits, the soil is stirred, and thereby exposed to the action of the elements, the more plant food will be formed, or be placed within reach of the roots. The roots of plants will not go down beyond the influence of the atmosphere, for the reason that they cannot *breathe* there, as elsewhere explained in our issue to-day. Hence if the subsoil is not loose and permeable by the air as well as water, it must be made so by the plow. The roots of perennials, by slow and persistent growth, from year to year, will force their way into comparatively compact soil or subsoil; but annuals, like wheat, corn, etc., and the various tuberous plants, such as potatoes, beets, carrots, etc., have no opportunity, by long and persistent growth, to force their way into the hard soil in search of moisture or food; the soil must be pulverized and rendered easily permeable to their tender and rapidly-growing roots, or the result will be as shown in the figure on the right of the engraving.

If the roots of a plant are kept near the surface they must dry up when a parching drouth comes. Pulverize the soil and let them go down. There is a great desire among American farmers to *spread out*—they want more land. More attention, too, is paid to extent than quality. Better far, would it be for them, if they would endeavor to extend their dominion *downward*—perpendicularly instead of longitudinally. Their titles are unlimited in that direction, and they can improve them without extra cost of fences.

Air is as necessary to the soil as water or manure, and it costs less than either; hence the farmer should not stint its supply. Air decomposes manures more effectually than water, and is absolutely essential to prepare their elements for the nourishment of plants. Air carries into the soil more or less ammonia and carbonic acid; hence it is equivalent to manuring. Air in passing through the soil, if it is able to penetrate it to any considerable depth, parts with a great amount of moisture, and hence supplies the place of rains or artificial irrigation.

The figures which accompany this article are fair illustrations of the difference in the size and vigor of plants, both below and above ground, when growing on shallow soil or on that made more suitable for their sustenance by deeper plowing and pulverizing.

Rearing Silkworms.

At the Academy of Sciences last week, Dr. Blake read an abstract of a paper translated from the proceedings of the Academy of Sciences in Paris. On account of the diseases prevalent amongst the silkworms in France, many experiments have been made in order to discover the best means of rearing them. The results obtained by M. Sintrae, and which were communicated to the Academy of Sciences in Paris in September, seem to contain facts which may be useful for the agriculturists of this State. This observer found that silkworms succeeded much better when raised in the open air than when kept in close rooms. His idea up to the present time has been that the worms require to be kept at a high temperature, and carefully preserved from sudden changes. M. Sintrae finds, on the contrary, that they bear very well a temperature as low as 47 degrees and as high as 104 degrees; that they are not injured by the direct rays of the sun nor by sudden changes in temperature. They were not hurt by rain, nor even by thunder-storms. The disease that has been so prevalent amongst silkworms in Europe, and which has called for so large an importation of foreign eggs, is considered by the author to be caused by the worms being confined in too close rooms. The only shelter he gives them is an open shed, with roof sufficient to keep off the rain. The yield of silk seems very satisfactory, as 38 ounces of eggs furnished 372 pounds of cocoons, besides a large yield of eggs.

Bad Policy.—The Tuolumne City *News* is authority for the following: "Notwithstanding the fact that our farmers are tillers of the most productive soil in the State, almost two-thirds of the vegetables used and the fruits consumed, is retailed to them by peddlers, who haul their produce from twenty-five to forty miles. This should strike our farmers as a very odd species of foolishness. In fact we do not believe the case ever had a parallel in any country, unless it was in some of the cotton-growing States ten or a dozen years ago. We are fearful that many of our hitherto successful farmers may yet have to learn the old maxim, "a dollar saved is a dollar made."

No farm should exist without its fruit and kitchen garden. The lack of fruit and vegetables on a farm are evidences of bad management and want of thrift. There seems to be a disposition among California farmers to devote their attention mainly to one product. It is all wheat, all barley, all fruit, all vegetables or all something else. Diversity of culture and rotation of crops, which is the acknowledged secret of success in every other country, appears to be almost totally ignored in California. This thing should be reformed altogether.

Tea Culture in Calistoga.—Mr. Samuel Brannan has started the culture of tea on his ranch at Calistoga, under the direction of a family of Japanese, which has been brought hither for that especial purpose. Tea-raising will soon become an important feature in California agriculture.

Tobacco in Massachusetts.—The single town of Hatfield, Mass., realizes $275,000 annually from its tobacco crop.

More About Opium Culture.

A correspondent of the *American Agriculturist*, writing with regard to the culture of the poppy for opium, says that he has experimented considerably in that direction, in the State of New York; and has sent specimens of the opium which he has raised to several medical colleges. A quantity was also sent to a chemist in New York City, to be examined with regard to the quantity of morphine which it contained, and upon which the value of opium chiefly depends. The report was that the specimen sent was fully up to the average of the best imported. He further writes as follows:

The first point to be considered in regard to this, as with all other crops is—will it pay? Mr. B. says: "It will pay, and pay well, if attended to rightly. I know that I can take an acre of land and get more money from it than from three acres in any other crop I ever saw. It is not an exhausting crop, but a good one to precede wheat. At $10 or even $8 a pound, it will pay better than corn or wheat. I am not afraid that many will raise poppies or that too much opium will be made. It is too small business to suit the mass of farmers. It is worse than a dairy in requiring close attention to business. The man of small means, with a little land, and who is close, careful and plucky, will make it pay. A good boy or girl can attend to a quarter of an acre, and have over half a day to spare. The labor of weeding and hoeing is no more than for carrots or onions. It is "small business,"—*i. e.*, full of minor details, the proper observance of which are necessary to success. Good, rich land is required, which should be pulverized and leveled as for an onion bed.

We have been frequently asked whether the seed can be readily obtained. The *Agriculturist* answers that question by saying that it is kept for sale by all the large seed-dealers in New York. It may readily be obtained from them by mail, in sufficient quantities for practical experiments. The seed for subsequent crops should be saved by the grower. It is not too late to obtain seed from New York and secure a good crop the present season.

A Hybrid Potato.

The Oakland *Transcript* makes the following reference to a very interesting experiment: Mr. Pryall, who lives out on Broadway extension, has recently been making some very beautiful horticultural experiments, all of which promise to culminate most successfully. One of these experiments, and the only one which we shall mention now, was undertaken for the purpose of obtaining a new variety of potatoes, by a system of hybridizing. Some of the potatoes raised by this method have a most beautiful, clear appearance, and we are assured that the flavor is vastly improved. The varieties experimented upon were the peach-blow and pinkeye, both of which are highly valued as articles of food. The product of these two varieties partakes of the character of both, containing as it does the best qualities of the parent kind. In fact, it is an improvement on either. The way in which the specimens exhibited to us were obtained, was this: Both varieties were planted on the same plat of ground, but in different rows. After the potato vines commence to bloom, the pollen or fecundating dust of the pinkeye is gathered and sprinkled on the blossoms of the peach-blow, which is then covered until the two qualities are thoroughly united. The result is, that the potato is a sort of mongrel, but superior to either of the species from which it is propagated.

Peach trees should not be set among apple trees. The peach is not so short-lived as many imagine, where it is properly pruned and cared for. By cutting back the old stocks, it is claimed that the tree may be made to last a life-time. Trees of all kinds planted in a bottom land or sheltered valley should be set further apart than when planted on hills. Ashes are very useful in the orchard. An orchard or vineyard can scarcely receive too much of this kind of dressing.

Cultivation of the Coffee Tree.

Various efforts have been made, from time to time, to introduce the culture of the coffee tree into this country. In the Atlantic States, Texas and Florida have been selected as fields for experiment; but we are not aware that any material success has thus far attended such efforts. The public was informed, some three or four years since, that a company with $3,000,000 capital had been organized for the culture in Florida. There were to be ten settlements of 1,000 people each. Dwellings and land were to be furnished by the company, rent free, to each family for ten years, at the end of which time deeds were to be given to each for forty acres. The profits to the company were set down at one million a year; but the project was altogether too speculative, and, of course, fell through.

There is no doubt but that coffee might be raised in both Florida, Texas, and in the southern part of this State. Several attempts have been made in Los Angeles and other places, to start the trees from seed; but almost or quite universally, we believe, without success. The reason for the lack of success has generally been attributed to the supposed fact that the seeds had lost their vitality by age. From what we can learn, however, we are rather inclined to the belief that the failure has most likely been due to the improper manner of the attempt at germination. If we are correctly informed with regard to these experiments, the seed has been placed immediately in the soil, exposed to the direct rays of the sun, with very little moisture, and in a condition of variable temperature; and that the result has been that they have failed to sprout. With such treatment the best and freshest seeds would be most likely to fail.

How to Plant the Seeds.

In the northwestern States of Mexico, where coffee is successfully cultivated, the practice is to plant the seed in October, at the close of the rainy season, under an artificial shade. The plants do not show themselves above ground until the next March or April—from five to six months. During all of this time the ground is watered daily. The seeds are planted in rows eighteen inches apart, and each seed from two to three inches apart. They grow to the height of about six inches at the close of the first year, and increase from fifteen to twenty inches each year afterwards, until full growth is attained. When the tree is to be transplanted, each plant is removed to the shady side of a plantain tree or castor-oil bean shrub, previously prepared for it, and some two feet from it. These plants being more rapid in their growth afford the necessary shade to the coffee shrub, and is cut down when the coffee tree comes into bloom. We have the above information from a gentleman now in this city, who has had personal experience in the culture of coffee in Mexico.

Another plan which we have seen recommended, may be described as follows:

The seeds, before being put in the ground, should be placed, enveloped in the natural dried pulp which holds the two halves of the berry together, into warm water, and kept there until they sprout. After the shoots have fairly put forth, they should be transplanted to the nursery, which should consist of moist, rich earth, *shaded from the direct rays of the sun.*

If no natural shade can be obtained, forked stakes should be driven, and poles laid across and covered with brush, at an elevation of four or five feet above the ground, so as to give ample room for free circulation of air beneath. The plants should be transplanted to the field at the close of their second year's growth. If put into the ground in the first place, there is danger that the proper and uniform degree of moisture and warmth will not be kept up, to induce the sprouting.

The statement is, that the seeds when placed in water, sprout in eight or ten days. We can scarcely think, however, that such would be the case, with seeds which require six months to germinate in moist ground; but a test of a few seeds can be readily made by anyone who is desirous of trying this mode of germination.

The Cultivation of the Tree.

To be cultivated to advantage, the coffee tree requires a climate whose mean temperature is about 68°; a fall below 53°, when the plant is in vigor, is extremely hurtful. It is by nature a forest tree, requiring shade and moisture. In many places, especially in Arabia, it is cultivated in the midst of scattered forest trees, in order to get the benefit of the shade from their spreading branches. The coffee, like most other forest trees, prefers the hills to the plains. In the best coffee countries the plantations are almost always located on the hills and mountain sides, which are cleared of their forest growth for this culture. The plant needs a rich loose soil; clay is especially unfavorable. New and virgin soils are preferable to that which has been previously tilled; although judicious dressing would undoubtedly keep the soil in good tilth for any length of time. The coffee tree is a great consumer of alkalies. It sends its roots very deep in search of moisture and food.

In some places, in setting out the trees, trenches are dug from four to five feet deep and three feet wide, into the bottom of which are thrown stones, decaying wood, etc., upon which the mold is placed. The object of this is to secure a more perfect irrigation, so that the tree may derive its sustaining moisture from below, upward. The tree requires a large amount of moisture until it reaches its third year, when it commences to bear. Its height, depending upon the moisture it receives and the nature of the soil, is from eight to twenty feet. When disposed to grow over twelve or fourteen feet high, it is usually cut back for convenience in gathering the berries.

Artificial irrigation will be essential to the cultivation of the coffee tree anywhere in this State. In fact, it is employed on almost all coffee plantations everywhere. Irrigation must be plentiful up to the time of flowering, but not in excess; but must be totally withheld while the berry is ripening. Even natural rains at that time are very injurious to the fruit. A dry climate, with proper artificial irrigation, is better for coffee than a climate with a plenty of natural irrigation from rains—for the former can be readily controlled. After the tree has attained its full growth it will require comparatively less irrigation than when young. In setting out for permanent growth, about 550 trees are generally allowed to the acre. The shrub should receive full attention for the first two or three years, and the ground kept as free as possible from weeds.

The plant commences bearing in its fourth year, and continues to produce fruit abundantly until it is past forty years of age. It lives to a great age. In Brazil it bears two crops a year—the principal one being gathered in the spring and a small one in the fall. The quality of the second crop is considered the best. The tree resembles very much a small pear tree—the limbs spreading very regular.

Kill the Fish.—It is both cruel to a fish and injurious to its flesh to allow it to die the lingering death to which they are usually subjected. A fish should be killed as speedily as possible after it has been taken from the water. There is about as much propriety in eating a drowned sheep or chicken as in eating a fish that has died in consequence of being taken from its natural element. The inhabitants of Holland are very particular in this respect, and always kill the fish by stabbing as soon as taken from the water.

Drainage.

Mr. Greeley devotes Nos. 10 and 11 of his series on "What I Know About Farming," to the subject of drainage. In the first number he gives his readers a description of his own farm, which is located in the town of Newcastle, West Chester county, N. Y. He details therein, at considerable length, the "difficulties" and "blunders" which he encountered in his efforts to effect a proper drainage of some twenty acres of swamp land which he found upon it, and the final "success" which attended his efforts.

In No. 11, he submits some general conclusions to which his experiences has led him, the first of which is as follows:

> While I doubt that there is *any* land above water that would be improved by a good system of underdrains, I am sure that there is a great deal that could not at present be drained to profit. Forests, hill-side, pastures and most dry, gravelly or sandy tracts, I place in this category. Perhaps one-third of New England, half the Middle States and three-fourths of the Mississippi Valley, may ultimately be drained with profit.

Drainage is no doubt a much more important matter east of the Rocky Mountains than it is in California; yet even here it deserves the attention of our farmers to a much greater extent than has yet been given to it. All swamp lands, of course, and all soils resting upon a substratum of clay should be drained; but it is difficult to give any general rules which shall be applicable to lands other than such as the above, by which the farmer may know when he should drain.

An experienced eye in looking over a field covered with a growing crop, may detect those portions, if any, which are affected by a surplus of water. In the Eastern States we often meet with crops which exhibit a want of vigor, which present a sickly hue of color, and in which the individual plants are not sufficiently developed. The unpracticed eye would be very likely to say that such a field was suffering from drouth, when the experienced farmer would at once perceive that the trouble arose from an excess of moisture—from water which was stagnant from lack of circulation by drainage.

If water stands upon or very near the surface, plant roots are drowned out. They must have air to breathe as well as animals; but the stagnant water keeps the air away. When drainage can go on, the movement of the water itself brings the air in contact with the rootlets. If we plant a tree in the richest soil, give it just the needed amount of water, but cover the ground for twelve or fifteen feet around it with an impervious cement, the tree will soon die for want of breath, just as sure as one of us would die if we were inclosed in an air-tight room.

Oftentimes, strange as it may seem, drained land stands drouths better than that which is not drained, for the simple reason that the former absorbs more moisture from the air, by means of the circulation which is established between the surface and the air spaces within the drains. The value of hundreds of Eastern farms has been doubled, and not unfrequently trebled, through the increased powers of production which have been imparted to them by a proper system of drainage that has cost but a tithe of their increase in value. Moreover, it is often the case that the higienic advantages derived from drainage are quite as important as those of a purely agricultural character; and by such means the sources of malaria are not unfrequently removed. No doubt some of the ague districts in this State might thus be greatly improved.

Surface ditching will very seldom accomplish the ends sought for in drainage. Underdraining is the only effectual remedy, and when that is undertaken it is better that it should be well done. Digging ditches and filling in with stones or bushes, as sometimes recommended, is poor economy; even covered drains of stone soon get out of order, and wooden drains decay. Porous tile drains are the cheapest in the end, and they are all the time much more effective than those constructed of any other material.

We believe draining has been practiced to some extent in California, for other purposes than the mere removal of the surface water, and to considerable advantage, and we should be pleased to receive from some practical California farmer his views of underdrainage as applicable to this State. It is a matter which has not yet attracted that attention which, in our mind, its importance deserves.

Grafting the Hickory.—The quality of hickory nuts varies much in the wild state, and the difficulties in the way of securing the best varieties by ordinary propagation have prevented any very large multiplication of the more choice specimens. Grafting forest trees, such as the hickory, has heretofore been considered a very difficult, and in many varieties an impractical thing. Mr. David R. Dickinson, however, writes to the *American Agriculturist* that after trying various methods of grafting the hickory but without success, he has finally hit upon the following with very satisfactory results:

Early in the spring he grafts the stock, which should be small, very near the surface, or, if possible, below it. The graft is waxed in the usual manner, and then the earth is heaped around to cover all of the scion except the upper end. Mr. D. has trees grafted on this plan now in bearing.

The Commissioners of Emigration in New York report that from January 1st to December 8th, 1869, there have arrived in that city 251,162 emigrants, against 208,101 during the same period in 1868—being an increase of 43,061. The receipts at the same time from emigrant fees have amounted to $805,128, and the disbursements to $517,837, with a balance in the treasury of $295,333. The balance in January 1st, 1868, was $8,041.

A man in Pennsylvania has two steers on which he challenges the United States to compete with him. One is six feet high, girths ten feet around the body, and weighs 3,425 pounds. The other stands six feet ten inches, girths ten feet two inches, and weighs 3,430 pounds.

To Save a Poisoned Dog.—It often becomes desirable to save the life of a valuable dog which has been accidentally or maliciously poisoned. The administration of flour and warm water will serve as an effective and most ready emetic, and if given promptly will often prove effective.

Farming and Gardening.—Planting Trees by the Highways; Deep or Shallow Plowing—Ill.; Rearing Silkworms; More About Opium Culture; A Hybrid Potato; Cultivation of the Coffee Tree; Drainage; S. F. Market Reports....214
Mechanical Progress—Hints to Boiler Makers; Boat Towing by Means of Wire Rope; Estimating the Power of Motors, etc....211
Mining Summary.—Items from various counties and districts in California, Arizona, Idaho, Colorado, New Mexico, Nevada..212
Reading for the Hour.—How Waste Matter is Utilized; Adoration of a Tooth and a Cloak; Habits of Frogs, etc.....228
Scientific Progress—Transmission of Electro Signals; Color of the Water of Lake Leman; Ammonium in Ammoniacal Amalgam, etc....211

Notices to Correspondents.

Chloride Bill, Humboldt City, Nevada. We find, on looking over your letter, that all the items you give have previously appeared in the Press. We should be very glad, however, to have you give us any special accounts with regard to the mines or processes.

G. L. M., Empire, Colorado.—We have forwarded to you the pamphlet you ask for, and would be most happy to receive any specimens for our cabinet.

New Subscribers.—Notwithstanding the dullness of the times, we are now receiving more subscriptions by mail to the Scientific Press than at any former period. The reduction of subscription rates and the increased variety of reading matter is having a gratifying effect. We are now frequently reminded of the value of the Pacific Railroad by receiving, almost daily, cash subscriptions coming from nearly every State in the Union. It has enlarged our field of usefulness, and stimulates us to improve every issue.

◆

Golden State Iron Works.—At these works, which were lately damaged by fire, but not as extensively as at first stated, the carpenters are busily at work, and the energetic firm are determined to get everything into running order in about two weeks. The engine and boiler, and much of the machinery being not seriously injured at the conflagration, we have no doubt but that Messrs. Palmer & Knox will carry out their determination.

◆

The Summit Valley Ice Company have a warehouse on First street, near the Miners' Foundry, and are daily receiving orders for their excellent ice. We have given a description of how the ice is manufactured in previous numbers.]

San Diego Gold Fields.

All accounts agree in stating that the first excitement was overdone. The specimens which have been sent to other places came from the Washington lode, delay in developing which has been caused by some dispute as to whether the Julian District comes within a Spanish grant, the Quill Mac, said to have been confirmed by the U. S. Courts. The prospecting is done in an irregular, hap-hazard sort of a way. But things will right themselves in the course of time. It is ascertained that there is no proper wash gravel.

Washington City, containing three stores, one a tent and the others log cabins, is situated in Washington Gulch. A short distance above the city, up the gulch, at the right, is Gold Hill, at the base of which runs the Washington ledge, above this the Hayden, then the Kelly and then the Lincoln, all on the same hill. None have been worked to any extent. The widest is not over three feet in width. The character of the rock is said to be the same in all.

There must be hard work done before the veins yield the gold they contain, and, perhaps, litigation. Many who have been there are reported to have left, disgusted with this fact. A good assayer is needed, and would probably get constant employment.

◆

Major-General Thomas.

The death of Major-General George H. Thomas on Monday last brought sorrow to every heart that knew him. A brave soldier, a most able officer and a true gentleman, he has commanded the respect and won the love of all with whom he came in contact. His military-history is too well known to need any statements here, and his fame rests on the solid foundation of historical sucesses.

We cannot refrain, in this connection, from reëchoing the sentiments expressed a few days ago by the *Alta*, in regard to the proposed reduction by Congress in the office of Major-General. We had five, and now by General Thomas' death, have four officers of this rank, and there is a movement being made in Congress, on the ground of economy, for reducing the number to three. If five men had deserved promotion to this office, they deserve to hold it; and it is the greatest ingratitude to deprive them of what they have won on the battle-field. No other country would for a moment entertain such an idea, and the consideration of a few dollars is most paltry in comparison to the injustice done to gallant officers. How General Logan can favor the measure, unless from envy, passeth our understanding.

◆

Increased Demand for Steam Stamp Mills.—The Wilson steam stamp mill, manufactured at the Pacific Foundry, in this city, for the Overman Silver Mining Company, of Virginia City, Nevada, can be seen in operation at the works on First street. Mr. Wilson is now busy filling orders from several other prominent mining companies on this coast. There seems to be an increasing demand for these mills, and we hope they will be the means of making valuable many mines not worked at present for want of sufficient capital to build mills on the old plan of equal capacity with the steam stamp mill.

◆

The State Senate passed, on Monday, Mr. Roberts' bill regulating the rights of owning claims. The owners of mining claims are to have a right of way to them over the claims or lands of others for access, and also for the purpose of draining, reaching them by tunnel, and for carrying off tailings, etc., in working. When this right cannot be acquired by private bargain, it may be granted on application to the County Courts, after appraisement of damages by commissioners appointed, whose report is subject to revision and approval.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending March 22d.

Lenger-Index.—Charles A. Fitch, San Francisco, and William O. St. John, Oakland, Cal.

Extracting Copper from its Ores.—Nathaniel Haskell, San Francisco, Cal., assignor to himself and Joseph F. Steen, same place.

Bolster and Axle-Bed Plates for Vehicles.—John Henry, Suisun, Cal. Antedated March 1, 1870.

Wagon-Standard.—John Henry, Suisun, Cal. Antedated March 1, 1870.

Medicinal Beverage.—Luigi F. Lastreto, San Francisco.

Gang-Plow.—Jacob Price, San Leandro, Cal.

Sheet-Metal Seaming-Machine.—John M. Veasey, Denver, Colorado Territory.

Dress-Protector.—Frederick Wittram, San Francisco.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

◆

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Improvement in Windwheels.—C. Mahler, S. F.—This invention relates to an improved wind-mill, which may also, when divested of its regulating parts, be employed as a water-wheel for driving machinery, or as a propeller-wheel for vessels floating in the water. On the upright shaft is a box through which, at right angles to one another, pass the two arms which hold the vans or sails, the two opposite vanes on each arm being placed at right angles to each other. The vanes, moreover, are so secured on the shaft that their greater width is below it, and the upper side is weighted. On the shaft which rises from the top of the box are the four arms of a governor, each pair being connected by rods with an arrangement of blocks within the box. Those blocks are in two sets, and are all wedge-shaped. Of one set, one is attached to each side of the box, with the narrow end lowermost; of the other set, one is attached to each rod (on the arms of the governor) with the narrow end uppermost. Thus, when two blocks, one of each set, are placed together, they form a square. The inclined surfaces of these blocks are corrugated, to prevent slipping. The operation is as follows: When revolving, the vane coming against the wind lies horizontally, presenting no surface for it to act upon, while the one on the opposite end of the arm stands vertically, receiving the full force of the wind, until the former comes to a position where it catches the wind, when, on account of one side being righted, it turns to a vertical position, at the same time turning the other vane to a horizontal position. To prevent turning too far, there is a lug or projection on the arm, inside of the box, which, when the vanes have turned the proper amount, strikes on the blocks above spoken of. Should now the wind increase to a gale, the arms of the governor will fly out and raise the blocks attached to them, and, on account of the wedge-shape of the blocks, less play will be given the lugs, and hence the vanes will be made to stand at an angle with the wind, thus regulating the speed. The wheel can also be mounted vertically, in which case the governor is dispensed with, the vanes feathering automatically, owing to their peculiar construction. When used as a water-wheel or propeller, it is entirely submerged. Protection for this ingenious mechanism has been obtained in England and France through the Agency of the Scientific Press.

◆

Improved Tie-Laying Machine.—J. R. Adams, S. F., Cal.—This device is intended to supply a method of laying down, in regular order, the ties which bind the opposite rails of a railroad track, which shall be simpler, quicker and less expensive than any now practiced. It consists first, of a pair of wheels, moving inside a properly constructed frame, which receive the ties in recesses made in their peripheries and lay them down upon the prepared bed as they revolve, carrying them around one-half of their revolution. Behind and attached to the frame is a car running on numerous small wheels which move on the ties already laid. Upon this a truck, which carries the ties forward from the rear, is propelled, so as to place these ties in a convenient position for depositing them in the recesses in the wheels. These recesses are at such a distance apart as is equal to the interval to be maintained between the ties when laid, and to prevent the ties from prematurely leaving them, there is a curved guard before each wheel. To lay the ties by this device it is only necessary to draw the machine along the road-bed, while a man at each side of the frame places ties in the recesses of the wheels, as these last revolve.

◆

Improvement in Dentistry.

In the United States dental surgery has taken a higher stand than anywhere else in the world, and our American dentists are not equalled in any other country. Indeed, the best and most celebrated of the profession in Germany are Americans, who, after being educated here, have gone to practice their trade in the Old World.

We were lately shown an instrument which promises to come into extensive use in filling and cleaning teeth, for it obviates to a great extent (almost entirely, some say) the pain and inconvenience caused by the present common method. It is no "wonderful discovery" but simply a scientific improvement of the dental instruments. Instead of the tooth being cut by forcibly pressing a sharp tool against the hard substance, the burrs are revolved at a very rapid rate by means of a small pneumatic engine, very ingeniously constructed, and of a size to be as easily held in one hand as the common tools. The rapid revolution of the burrs cuts quickly and painlessly, as can be readily tested by a visit to Dr. Gillespie. The principle, which is nothing new, can indeed be seen in any shop where a saw is used for cutting instead of an axe, and anyone can see how much all disagreeable shocks can be avoided by the quick revolution of a sharp cutting tool. We have not space to give a full description of the "Pneumatic Burring Engine," as it is called, with its additional appliances for saving the teeth and its universal gear joint attachments, by means of which the burrs can be used in any position; but we advise those about to have their teeth filled, or dentists who desire to keep up with the age, at least to visit Dr. J. P. Gillespie at 313 Bush street, and see his instrument, for which the doctor is agent for this coast. Dr. G. is a gentleman of some twenty years practice in dental surgery, and this contrivance grew out of his experience in operating. This machine, while not wholly doing away with the use of hand instruments, still supplies their place in most of the operations.

◆

Improvement in Screw-Bolts.—Mr. Rutter, civil engineer, and a resident of Vallejo, has made an important invention, designed for locking nuts upon screw-bolts, the object of which is to prevent nuts from working loose on the bolts, as on fish plates for rail-joints, in use for gunnery, and in quartz mills. The Vallejo *Recorder* says that the chief engineer of the California Pacific Railroad Company has tested rail-joints for nearly a month, with great satisfaction, and twelve joints are undergoing severe tests on the Central Pacific Railroad at Sacramento, and if these trials succeed, of which there is but small doubt that they will, Mr. Rutter's invention will, no doubt, become universally adopted. Patents for this invention will probably soon issue both in the United States and Europe.

The Use of Electro-Silver Copper Plates for Saving Gold in Quartz Mills.

The Superintendent of the Kanaka Gold Mining Company writes as follows:

"I saw in the Press of March 12th, an article speaking about the silver-plated copper amalgamating plates of Mr. Edward G. Denniston, of the San Francisco Plating Works, and, partly in justice to that gentleman, but mostly in the interest of all my brother millmen, I would give you my experience in using these plates, which I have now employed for over two years, to great satisfaction. It is just about two years since the idea of using such plates occurred to me. I tried first, a fifty-cent piece pounded flat, which I nailed to a common amalgamated copper plate, and found that I saved on this so treated half-dollar piece more amalgam, in proportion, than on the copper plate to which I had the same fastened."

The writer states that he first commenced using these plates in Calaveras county, and that he is now employing them in a 20-stamp mill of the company named above, in Sierra county. He uses no other kind of plates. He employs 105 linear feet of plates for his five batteries. He refers to his mode of treating and using the plates as follows:

After receiving the same from the plating works I wash them off with a very mild solution of sulphuric acid, by the help of a soft sponge, then rinse them off thoroughly with clean water. After this I take another sponge and a mild solution of cyanide of potassium, wash the plates again off, and use the same sponge and solution for charging the plates with *good prepared* clean quicksilver, which will instantly adhere. Just charge enough quicksilver, but not too much. The first twenty-four hours the plates will not save as much amalgam as afterwards. I found it necessary to clean the plates off every twenty-four hours, and *never* to allow the amalgam to become hard on the plates. In such a case I would wash the hard spots of amalgam off with quicksilver.

Not to lose any time to handle the plates, I have my plates laying loose in the sluices, and have, at intervals in the sluices, according to the length of the silver plates, crosswise, a small piece of sheet iron nailed, the lower edge standing up a little, just enough to put the silver plate under this crosspiece, and so to hold the plate in its place. This way, each plate can be taken out at any convenient time, the amalgam taken off, the plate dressed and laid in again, and the mill never need to be stopped for such purpose. The amalgam I have taken off by the help of a piece of india-rubber belting cut straight and at a right angle. After the amalgam is taken off, I wash the plates again with a mild solution of sulphuric acid or cyanide of potassium, but a very mild solution, then charge them with quicksilver, rinse well off with clear water, and put the plate into the sluice for use again.

I have taken from my upper plates as high as twenty pennyweights of hard amalgam in twenty-four hours, where I at the same time took from our common amalgamated copper plates not one-half the amount of amalgam, and the sulphurets were producing stains on the common copper plates, when the silver plates remained as bright as a looking-glass. I would advise never to allow the amalgam to become harder on these silver plates than to be removed by a piece of india-rubber as above. The plates should not be brushed or otherwise touched while they lay in the sluices. My experience proved to me that such plates will pay for themselves in less than one month by the greater quantity of amalgam and by the work saved.

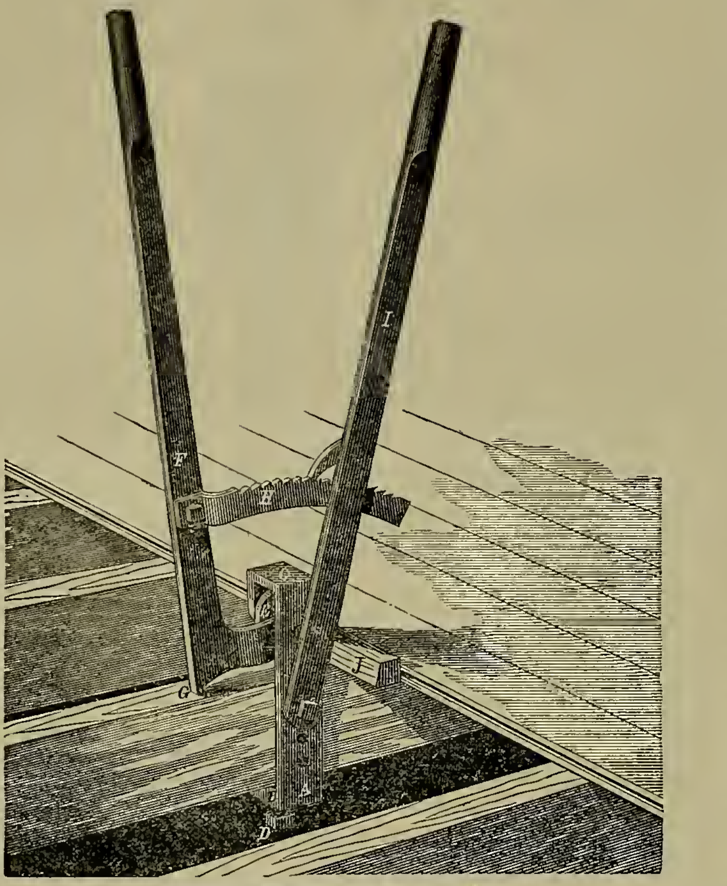
◆

Light Houses.—In England there is upon an average one light-house to every fourteen miles of coast; in Scotland, one to every thirty-nine miles; and in Ireland, one to every thirty-four miles. About half the lights are dioptric, and the remainder catoptric. The usual consumption of oil in a first-class dioptric is 700 gallons per annum. The cost of an apparatus complete is about £3,000; sufficient elevation being given, in clear weather a first-class light may be visible 100 miles. Practically, 250 feet from the water is considered the maximum; this gives a horizon of 18 or 20 miles. The last novelty is the division of the lantern into sectors of different colored light, thus throwing a different color toward different quarters of the horizon, which is of great utility in guiding to the entrance of harbors.

Improved Flooring Clamp.

From Colorado comes a very useful device for clamping together the boards, in laying floors, before nailing, and one which would seem to be desirable for carpenters. It is made of wrought iron, and can be quickly applied, as there is no tedious operation of turning screws necessary, while by placing it on the joist and pulling the levers apart, the boards are effectually clamped.

A represents the stock of the clamp, which has two right-angled brackets, B and C, which in use are placed over and under the joist. The lower bracket turns up about one half inch, leaving an opening between it and the upper bracket to receive the joist. The lower bracket is provided with a set-screw, or stud, D, to bite into the wood, to prevent slipping. The upper bracket supports a hinged tongue, E, which covers the opening and steadies the clamp. Near the top of the stock a cranked lever, F, is pivoted to A, having a sharp heel, G, which, when in use, bites into the top of the joist to prevent slipping.



NEVIN'S IMPROVED FLOORING CLAMP.

It is also provided with a segmental rack, H, to hold what is gained by the clamping lever, I, which is provided with a pawl to catch into the rack, H. There is also a number of holes in the stock, A, so that the levers, F and I, can be altered at pleasure, to suit different depths of joists.

To use this device, raise the tongue, E, and place the stock, A, on the joist, having previously placed a loose piece of wood, J, between the lever, I, and the edge of the board, and reaching from the joist on which the clamp is placed to the next one on the right. Then the one movement of pulling the levers apart fastens the clamp on the joist and clamps the floor; for this movement presses the set-screw, D, into the botttom and the heel, G, into the top of the joist, and the lever, I, is pressed up against the boards.

It is claimed that the economy of time and labor effected by this machine will pay for its cost in a few weeks. It certainly seems to be a device which fulfils the need long since felt of some machine for this purpose.

Persons desirous of further information, or of purchasing, at reasonable terms, the patent right for California, can apply to the inventor, David Nevin, Georgetown, Colorado Territory.

National School of Mines.

Senator Stewart's latest bill provides for the appointment of a Comptroller and two Professors, one of chemistry and metallurgy and one of mining engineering. The school, until otherwise provided by law, is to be located at one of the mints or assay offices of the United States. It is proposed to appropriate $50,000 for books and apparatus.

Senator Stewart has been untiring in his efforts to establish a school of mines, and deserves great praise for his perseverance. But it would seem as if there would be required still more exertion before he can carry his point. Apparently, he hopes now to induce our economical Congress to take action by proposing a small beginning, and then gradually build it up properly. We are afraid, however, that a commencement on so small a scale may work disastrously. Nobody will be attracted to the institution except a few persons in the immediate locality of the school, and then it will be argued that the United States cannot and ought not to appropriate public moneys for the benefit of these few individuals.

If we are to have a national school of mines, it must be properly supported and made worthy of the subject; and to get an appropriation, the Western States and Territories must first unite in deciding on the location, and then direct their representatives at Washington to use their combined efforts to pass the measures. So long as California is opposed to having the institution at Washoe, and Nevada to having it in California, and Colorado to having it at either place, other Congressmen will justly think it a useless affair. If we cannot agree in this matter, we may as well give up the idea.

◆

The Trench mine at White Pine, near Hamilton, Nevada, bids fair to rank with the best mines in that district. The company are taking out large quantities of ore, which they are selling at $100 a ton on the dump as fast, we are told, as they can take it out.

◆

The School of Art for women in London is prosperous. The number of students is 128, and their efforts are highly spoken of. The school is free from debt.

Dualin—Dynamite.

In our issue of January 22d, we made some remarks on dualin, giving it as the invention of Mr. Nobel. We have received a communication from Mr. Carl Dittmar, formerly of the Royal Prussian Artillery, now at Boston, and as Mr. D. gives the best of references, among them Gov. Claflin of Massachusetts, and Gen. Foster of the U. S. Corps of Engineers, we condense the substance of his letter, which we have not the space to publish in full. We readily retract anything wrong in our article. The following is from Mr. Dittmar's communication:

Sombrero, an Italian chemist, not Mr. Nobel, was the inventor of nitro-glycerine. Mr. Nobel, however, was the first to apply this compound to blasting purposes, and the first who endeavored to lessen the danger of handling and using the substance, by mixing with it common powder and also of increasing its effect. Mr. Nobel is likewise the originator of the idea of using fulminating caps for exploding nitro-glycerine and dynamite, but invented neither dynamite nor dualin.

Mr. Carl Dittman, in 1862, resigned his commission in the Prussian Artillery and the position of Assistant Director of the Government Powder Mills at Spandau, near Berlin, to take the place of Director in some large private powder works. In 1866 he became Technical Director with Mr. Alfred Nobel, whose first nitro glycerine factory he built at Kruemmel, near Lauenburg. Here he invented dynamite, for which Mr. N. obtained letters patent in the United States, without Mr. Dittmar's knowledge.

As far as safety alone is concerned, dynamite has many advantages over nitro-glycerine, yet it does not come up to the standard of an explosive which will combine all the advantages of common powder and nitro-glycerine, without, at the same time, being liable to any of the objections to which either of these explosives is subject.

Dynamite will pack together in cold weather, thereby becoming inexplosive, and necessitating, before use, the thawing or warming process; it cannot be exploded without a cap containing fulminate, and it is not as strong as pure nitro-glycerine. Continued researches and experiments led me to the discovery of my improved compound dualin. This I claim to be safer than common powder, as strong as nitro-glycerine, and in its application cheaper than either.

On my arrival in this country, hardly two months ago, I found that quite a number of American patents have been granted to certain parties, for explosive agents and various apparatus used in their fabrication, all and every one of which had been originally invented, fabricated and used, and finally abandoned or improved upon by myself years ago in Germany.

It may be sufficient to state that on December 5th, 1867, protection by letters patent (No. 3,458) "for the production of material for blasting and similar purposes," was granted me in England.

In regard to dualin, I would only say that Mr. Nobel has never fabricated a single ounce of this compound, which, for European markets, is expressly furnished from my factory at Charlottenburg, near Berlin. The three American letters patent which I hold, grant me the desired protection in the fabrication of my powder within the territory of the United States.

Dualin is not composed of nitrate of ammonia and sawdust, else it would be very sensitive in attracting moisture; and water-tamping, such as I recommend in preference to other tamping, would be out of all question. It is, under all circumstances considerably stronger than dynamite; chilled cast iron plates from sixteen inches to twenty-three inches thick have been broken into fragments by the explosion of a small quantity of dualin placed on the surface of the plates. Dynamite, in even larger quantities than the ones in which my powder was used, had, on similar plates, produced no effect whatever. These experiments were made in December last, on the artillery practicing field at Tegel, near Berlin.

The above communication has been delayed several weeks by press of matter.

◆

A caisson for the East River Bridge, to connect New York and Brooklyn, was launched on the 19th inst., in the presence of a vast crowd. This bridge is one of the most interesting engineering operations now going on in the U. S.

Report of Samuel S. Fisher, Commissioner of Patents.—1869.

[CONTINUED FROM PAGE 204.]

Honest and Skillful vs. Cheap and Unreliable Patent Agents.

Where establishments are organized for the purpose of procuring patents, they are apt to become more solicitous about the number than the quality of those which they obtain. This tendency is aggravated by those who solicit patents upon contingent fees, or who, without special training or qualifications, adopt this business as an incident to a claim agency, and press for patents as they press for back pay and pensions. Such men are more desirous of obtaining a patent of any kind and by any means than they are of obtaining one which shall be of any value to their clients. Inventors are often poor, uneducated, and lacking in legal knowledge. They desire a cheap solicitor, and do not know how to choose a good one. They are pleased with the parchment and the seal, and are not themselves able to judge of the scope and value of the grant. Honest and skillful solicitors, with a thorough knowledge of the practice of the office and of patent law, and who are able and willing to advise their clients as to the exact value of the patents which they can obtain for them, may be of much service to inventors. There are many such; but those who care for nothing but to give them something called a patent, that they may secure their own fee, have, in too many cases, proved a curse. To get rid of their clients and of trouble, they have sometimes been content to take less than he was entitled to, while in many cases they have, with much self laudation, presented him with the shadow when the substance was beyond his reach. Between such men and the office the strife is constant. They have the ear of their client, and, to some extent, of the public, and much of the misrepresentation of the spirit and character of the work of the office is direcctly traceable to this source. It must be said, however, in justice to attorneys, that many inventors are so foolish as to wish to obtain patents for trading purposes, or as a salve to wounded expectations, even when they know that the grant covers nothing of value unless it be combinations which, if never made before, are never likely to be made again, even by themselves.

Registration System of Foreign Countries.

The patent system in vogue in Europe is substantially one of registration. Patents are granted upon the application of the inventor, without examination into the novelty or utility of the invention. The responsibility is thrown upon him of so framing his specifications and claims that they will bear the test of subsequent investigation. This he does at his peril; and if he attemps to make any preliminary examinations into the state of the art, he can do it only by the aid of solicitors, whose charges are far greater than the fees for a similar service would be if the work were done by sworn officers. But, although no examination is made, the patent fees abroad exceed those which the inventor pays in this country. This will appear from the following table:

Countries.	*Duration of Patent.*	*Fees.**
United States	17 years.	$ 35 00
Great Britain	14 years.	875 00
Farnce	15 years.	300 00
Russia	10 years.	450 c0
Italy	15 years.	250 00
gavaria	15 yesrs.	115 00
Austria	15 years.	350 00
Belgium	20 years.	420 00
Prussia	15 years.	100 00

*In a majority of the foreign countries mentioned the fees are much less for shorter periods than the full terms mentioned.

Proportions of Rejected, Amended and Patented Cases.

That the foreign plan is inferior to what I have called the "American system" of examination will appear from the following considerations: During the year 1869, 19,271 applications were filed in the United States Patent Office. Of these, 5,285 were rejected finally, and no patents were granted upon them. These constitute about twenty-eight per cent. of the whole number. By the English or foreign system all these rejected applications would have become patents, and 5,285 worthless patents would have been foisted upon the country. But this is not all. Of the 13,986 patents which were actually issued, about 12,500 were rejected in the first instance, and were only finally allowed after material modifications of the specifications or claims. By far the greater part of these modifications were in the nature of limitations of claims, which would otherwise would have been too broad. In other words, the applicants for 12,500 of the patents issued during the past year originally claimed too much, and were required to abate their pretensions before the grant was made. If the patents had been issued as they asked for them, they would have deceived the public as to the scope of the inventions and the state of the art.

Validity of Patents.

It may be safely asserted that the large majority of the patents issued from the patent office are good and valid; and, if rightly read and properly construed, fairly represent the status of the inventions in the arts to which they relate, so that no one who adopts ordinary precautions need be deceived by them as to the character of the inventions patented. It is a testimony to the thoroughness of the examinations, and to the public appreciation of them that while no man would buy a lot of land at any price without an examination of the title by competent counsel, thousands of dollars are freely invested in patents upon mere verbal representations, and with scarcely a reading of the document. That much loss has been the result of this easy-going confidence may be asserted, but very few such losses occur which ordinary prudence and business sagacity might not have prevented.

Questionable Reliability of Foreign Patents.

Under the foreign system, however, neither patentee nor public can have any confidence in the patent, however carefully it may be construed or scanned. It represents nothing more than the "guess" of the inventor as to what his invention may be, unsupported by any investigation or adjudication whatsoever. It is sometimes said that no patent can be known to be valid until tested by litigation, and that, therefore, a registered patent is as good before liligation as one granted upon examination. To this it might well be answered that frequently neither a first nor a second suit fully developes the state of the art or confers a fixed validity upon a patent. It may also be asserted that the machinery of the courts is not as good for the examination of mechanical questions as that of the Patent Office. A more conclusive answer is, that by the system of examination, one-third of the applications are not patented at all, and the remainder are so winnowed from the chaff of false claims that they are necessarily better than if issued as originally presented. Every process of examination compels the supposed invention to assume to some extent its proper place in the art, and, to that extent, adds validity to the patent that has passed its ordeal.

Unpopularity of Foreign Patent Systems.

Indeed, the lack of this examination and the practice of granting patents to the first introducer, as well as to the first inventor of a new improvement, has led to a movement abroad against the whole patent system. Its enemies clamor for its abolition. Its friends demand that it be improved, and the improvements which they suggest is the adoption of the American system. One or two smaller powers have declared against protection by patents; not so much, it would seem, to destroy the monopoly of their own inventions, as to obtain the free use of those made by their neigbbors. In the abolition of patents this nation, which during the last year patented more inventions than all the rest of the world put together, would of necessity be the greatest loser. It would give much more than it could receive in exchange.

I doubt if any one can seriously advocate or desire a change of our system, unless it be disappointed applicants, who would rather have bad patents than none, their counsel, who share in their disappointment, and such patent solicitors as hope to increase their fees by making for the inventor, at much cost of fees, that examination which the office now makes for the moderate charge of fifteen dollars.

A system of registration is, however, at present, practically impossible. It would be a simple outrage upon inventors and the public, if either were prevented from making any examination whatever into the state of the art prior or subsequent to the grant of the patent. Until the drawings are printed or copied so as to be made accessible to the public, this can never be done. This subject is, however, considered elsewhere.

[TO BE CONTINUED.]

* * *

The Paris *Cosmos* states that a material which can be pressed into the form of combs, buttons, knife-handles, etc., may be made from leather scraps by cutting them into smaller pieces and keeping them for several days in chloride solution. In this way they become hard and brittle. After being washed they are dried, ground to powder, and mixed with glue, or a solution of gum arabic, or any other adhesive substance, when the mixture is ready for the molds.

Educating Workmen in France.

A most interesting and instructive example is given by the conduct of the French company called Les Messageries Imperiales towards its employés at La Ciotat, a small town in the south of France, containing 10,000 inhabitants, who are almost all families of workingmen employed by the company. What this company does and the lesson it teaches are so well worthy of universal consideration that we condense the account given by the *Railway News:*

The company is the proprietor of a large fleet of Mediterranean steamships. It is not more than fifteen years since it obtained possession of La Ciotat and made contracts for the French government in the Mediterranean, and in this time it has succeeded in driving off from the coasting trade English competition, which previously controlled almost exclusively this sea. Indeed, so well is everything managed and executed by this company, that, in the English Parliament, the representative of the Treasury stated that the interest of England and its colonies would be best consulted by giving it a part of the mail service before entrusted to the English Peninsular and Oriental Company.

The engineers and superintendents of the company are all persons who have received the best education provided in France. Employing educated men has proved so successful that even the workmen receive special instruction. The infant and elementary schools of La Ciotat are wholly, or very largely, supported by the company. At the age of fourteen the boys commence their technical instruction, given specially by this concern. An apprenticeship in the works of La Ciotat is, from beginning to end, a course of technical instruction, and the foremen and workmen teach the youth and delight therein. The company has done away with the system of obligatory apprenticeship for a fixed period. The children not only receive wages from the moment they enter the establishment, but these wages are increased as soon as greater knowledge and skill enable them to do better work.

But their apprenticeship is not merely a school for mechanical dexterity. The company has a school-room, in which all the apprentices are educated gratuitously one hour each day, and that hour counts as one of the ten hours of their day's work. Attendance at this school is compulsory; but there is also an evening school which those may attend who wish. Three evenings a week plan-drawing, designing of machinery and of ships and ornamental drawing are taught gratuitously. The men attend and work diligently; and there is the strong inducement that the company selects the responsible engineers of steamships from those who have distinguished themselves in this course and take the highest places at the annual examination, at which gold and silver medals are awarded. The company also provides a library. The formation of bands of music is encouraged. Workmen's houses have been erected with all the modern conveniences, and each having a garden attached. The houses are let for $13 to $20 a year. With a further view to economy, the company has organized a market for the workmen. It has founded hospitals and savings banks, provided funds for sickness and death, and pays members of the religious orders to attend to the moral and religious education of the people.

The result of all this is apparent and important. The number of crimes committed at La Ciotat is surprisingly small. There is no trouble from strikes. The work done is excellent and the managers say that, in a money point of view, the company reaps an ample reward in the superior intelligence and steady conduct of their workmen.

It is to be hoped that a plan so beneficial to both parties may be adopted in other large works. The grand agent for elevating and refining the masses now-a-days is education. The advice cannot be given too often nor urged to strongly, educate, *educate*, EDUCATE.

* * *

Resuming Specie Payments.—The Merchants' Bank of St. Louis resumed specie payments on March 10th. This is the first step taken in this direction.

Gunpowder Explosion in a Mine.—A short time ago a cask of powder exploded at Morfa Colliery, in Wales, resulting in the death of twenty-three persons.

The New Copper Process.

Dr. T. Sterry Hunt writes that the experiments at Harvey Hill have been retarded by the inefficiency of the lixiviating tubs. He has, however, a plan which promises to overcome the mechanical difficulties. Trials with a Freiberg barrel gave the following result: The ores, dressed to about twenty per cent., and containing the copper as sulphurets (yellow and purple ore) with considerable amounts of carbonates of lime magnesia, were passed through a sieve of forty meshes to the linear inch and calcined at a low red heat, after which they held five to six per cent. of copper as soluble sulphate and the rest as oxide. Charges of 300 and 400 weight of this were treated in the bath of protochloride of iron, previously heated to 212° Fah., and after six hours' agitation in the barrel, the gangue was found to contain not over 0.5 per cent. copper. From the solutions 100 parts of metalic iron precipitated 170 to 172 parts of pure cement copper. The precipitation is very rapid in tanks, having the iron arranged on gratings at different levels, the liquid being kept hot by introducing a little steam. The reactions are: 1st. From the bath, oxide of of copper precipitates oxide of iron, forming chlorides of copper. 2d. From these chlorides, metallic iron precipitates metallic copper and regenerates protochloride of iron. These reactions alternate with one another, and with certain precautions the same bath can be used indefinitely. In the trials made the amount of protochloride regenerated was 80 per cent. of that in the original bath. The deficiency may be supplied by the action of sulphurous acid on the precipitated iron oxide. Rather than using the sulphurous fumes, as described in the British specification—which process has the practical disadvantage that the oxygen of the air, always present, raises the bichloride of copper to protochloride at the expense of a portion of decomposed protochloride of iron—he treats with sulphurous acids the insoluble residue from the solution of the oxide of copper. The turbid solution, rapidly drawn off from the gangue, soon deposits its suspended iron oxide in a settling tank, which is treated with sulphurous acid after the liquid has been drawn off to the precipitating vats.

The cupric chloride, so powerful in dissolving copper from copper-glance, purple ore and rich regulus, is feeble with copper pyrites, and only the iron of the double sulphide is attacked. The reaction is analogous to that between chloride of copper and sulphide of silver. A solution holding cupric chloride and common salt chloridizes and dissolves both silver sulphide and metallic silver. Advantage of this reaction has been taken in treated ores containing gold and silver, and trials have shown that in the case of an argentiferous copper ore the silver is readily extracted by the iron bath, from which it may be precipitated by filtration through spongy copper. With rich regulus holding gold, the gold goes with the residue, after extracting the silver and copper by the bath, and is in a favorable condition for removal by chlorination; which denotes that good results may be expected from the application of the process to our gold and silver-bearing copper ores.

Migration of the Whale.—The author of "Narrative of a Naval Officer" says: "From what I am able to learn of the natural history of the whale, she brings forth her young seldom more than one at a time in the northern regions, after which, with the calf at her side, the mother seeks a more genial climate to bring it to maturity. They generally reach Bermuda about the middle of March, where they remain but a few weeks, after which they visit the West India Islands, then bear away to the southward, and go around Cape Horn, returning to the Polar Seas by the Aleutian Islands and Behring's Straits, which they reach in the following summer, when the young whale, having acquired size and strength in the southern latitudes, is able to contend with his enemies in the north; and here also the dam meets the male again. From my own experience, and the inquiries I have been enabled to make, I am tolerably certain that this is a correct statement of the migration of these animals, annually making the tour of the two great American continents, attended by their young.

Mining as a Business or for Investment.

The London *Mining Journal*, January 15th, contains a communication from Mr. Charles Thomas, in which he discusses the merits of mining compared with other pursuits. His remarks were designed to apply to mining in England, where it has been prosecuted for centuries. If applicable to that country, with how much more force will they apply to the Pacific coast, where the business is yet in its infancy, the greater part of the country unexplored, while, with few exceptions, the surface of the explored ground has been merely scratched? No man is in a condition to say where the mineral deposits commence or where they end.

Mr. Thomas says: "Mining, although one of the principal sources of our natural wealth, is only thought of as a speculation, but is usually considered more risky than any other reproductive expenditure of money. There is a great deal of force in the prejudice; but, on the other hand, in justice to mining, it ought to be conceded that risk attaches to everything, and, therefore, that the risks of mining are only risks of degree. What are the risks of mining? They are various, and often serious." He enumerates a number of contingencies, few of which have application in this country. He then refers to the ordinary risks in other pursuits, and then to the list of bankruptcies at the close of the last and the beginning of the present year, and asks how many of the bankrupts are connected with mining, or how many of them may trace their misfortune to mining? It would be, of course, a rash assertion to say that their misfortune is owing to a want of connection with this industry; but it generally does appear that mining furnishes fewer names to "*The Gazette*" than almost any other industry of the Kingdom. "There is, in truth, no more speculation in mining than in ordinary business pursuits. As an investment, mining may not only be trusted in for dividends, but for a high rate of interest," provided only that it is pursued, like other business callings, for legitimate mining produce, as distinguished from market price premiums. Much demoralization has been occasioned by premiums, and it would be well were they to be more generally and strenuously disapproved. "Mere scheming for paltry premiums divests mining of its purely commercial character, and frightens persons from embarking in it, whose check-books would otherwise be ready."

Again, C. Chipman, in his "Mineral Resources of Northern Mexico," just published in New York, after describing the immense mineral wealth of that country, which he estimates could, with modern science and machinery, be made to produce, in silver and gold alone, £200,000,000 or $1,000,000,000 annually, discusses the question: Is silver mining a speculation? and concludes that, compared with farming, the risks are no greater, if so great. Mining for silver and gold, if entered into with the same business precautions that are generally observed by business men who engage in merchandising and mechanical pursuits, would present less hazards, and be attended with less failures than any other employment or business. He says much more, which may interest, perhaps console, Californians who have money invested in that country.

An English company, the "North Del Rey," mining for gold in Brazil, paid dividends last year to the amount of £53,000, thus returned in profit for the year the entire capital paid in.

California may point to the Eureka, and the Amador, and perhaps others which did more, and have done so for many years in succession—have returned hundreds for dollars invested in the actual development of the mine and erection of works.

M.

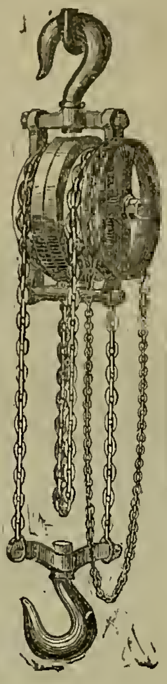
* * *

A Large Sewer.—West Philadelphia is building a great sewer. The section now in process of construction is two thousand six hundred and forty-seven feet long. The stone wall is at least thirty feet wide at the base, but becomes narrower towards the top. The conduit is of twenty feet diameter from side to side and of about nineteen feet height. The upper half is a semicircle, and the bottom, of course, is thus flattened. The inside cross-section area is two hundred and seventy-nine feet. It is estimated that 300,000 cubic feet of water per minute can pass through this conduit on a gradient of 322 feet per mile, or 7⅜ inches in 100 feet.—*Artisan.*

A New Pulley Block.

Among the devices which have been made in this direction, we find the following English device described in the *Ironmonger*. As we have given, from time to time, accounts of improved pulleys, we add this, which is worth noticing:

"The block is made on the differential principle. The lifting chain is passed over two sheaves, each of which is geared internally, the one having one or more teeth in excess of the other. Revolving around these internal teeth is a pinion, actuated by an eccentric, which is keyed on to a shaft passing through the center of the block, with a bearing at each end in the outside frame of the block. At one end of this shaft is a wheel with an endless hand chain passing over it; this gives the motion of the eccentric shaft. The teeth of the internal pinion are broad enough to gear into the teeth of both the sheaves, but as there are more teeth in one than in the other, they (the teeth) are not exactly opposite the other, and therefore will not admit the teeth of the revolving pinion without moving; but the tooth of the pinion, acting as a wedge, and entering with great power, pushes the one tooth forward and the other tooth back; and this continually occurring, a continual rotary motion is given to the sheaves, in opposite directions, with a power which is proportioned to the number of the teeth, the throw of eccentric, and the leverage gained by the diameter of the hand wheel. The lifting chain is passed over the one sheave, then down, and up over the other, the two ends being attached to a powerful cross bar, to which is connected the lifting hook. By this means the weight is distributed over the two sheaves and the two parts of the chain, increasing the safety and diminishing the friction of the block.



The blocks are very simple in construction, and are not at all liable to get out of order; the construction being such that the weight cannot run down, though the men lifting let go the chain. They hang quite plumb when in action, and the men are able to stand clear away from under the load, and the hand-wheel chain can be worked at any angle."

* * *

A New Publication.

We have received the initial number of the *Technologist*, which was born in February in the city of New York. The journal is especially devoted to engineering, manufacturing and building, and is published by the "Industrial Publishing Company."

From a personal knowledge of some of the managers, we were prejudiced in favor of this journal before looking at it. We happen to know that there is here combined a sufficient capital, extensive journalistic experience and great scientific ability. And our *a priori* judgment was not disappointed. The appearance and general arrangement of the publication are very pleasing, the illustrations are excellent, and the subject matter is of the highest quality.

The purpose of the publishers is most praiseworthy, and we believe they will persevere in their aims. They assert that they edit it solely in the interest of the subscribers. While, of course, we don't believe that they intend to impoverish themselves for the general welfare, we do believe, from the character of the management, that the acquisition of a high reputation is their *chief* object, and that this will lead them to the most indefatigable exertions in placing their paper in the first rank. We cordially extend the right hand of fellowship to our young brother with the old head and high aims, and wish him all success.

* * *

A steel coil spring, sixty feet long, five inches wide and three-sixteenth of an inch thick, has lately been made in Pittsburg, Pa.

New Books.

A History of Oregon. 1792 1849, drawn from personal observation and authentic information. By W. H. Gray, of Astoria. Published by the author for subscribers. Portland, Oregon: Harris & Holman. San Francisco: H. H. Bancroft & Co. New York: The American News Co. 1870. 8vo, cloth; pp. 624.

This book is a valuable addition to the historical library. The author is one of the oldest of pioneers, having gone to Oregon in 1835 and having resided there since, and having taken a prominent part in many of the events described. He puts many things in a new light; but speaks as one of authority, and brings strong documentary proof for his assertions. He has given no place to poetical effusion, but talks plainly and deals always with facts. We cannot give a better idea of the scope of the work than to quote from the introduction, premising that he brings in all cases very strong proof of his assertions:

> We make no claim to literary merit or attractive style; the facts we have collected, the proofs we are able to give of the policy and practices of one of the most gigantic frauds ever continued for a series of years by one professedly civilized and Christian nation upon another, in chartering and continuing to license a monster monopoly; and the manner in which they have sought for a series of years to prevent American trade and settlement of the western portion of our country, is contained in the following pages. We can only give the principal events, which in the future may be better arranged in an interesting a authentic history, which we must leave for others to write. The reader will find in the following pages: I. The American history of the Hudson's Bay and Puget Sound Agricultural companies. II. The causes of the Protestant mission, the causes of Indian wars, and the causes that must tend to the utter destruction of the Indian race on the American continent. III. The adverse influences that the early settlers had to contend with in coming to and settling in the country, fully explained. IV. A concise history of the early settlement of the country, a short sketch of many of the public men in it, their public character and proceedings, and the organization of the provisional government. V. The mining and agricultural interests of the country.
>
> There are two grounds upon which every fact is based: 1. Personal knowledge, observation, and participation in what stated for one-third of a century. 2. The written and printed statements of others, so compared that conclusions are intended to be without a possibility of truthful contradiction; thus making this a standard history of the country for the time included within the period from its discovery by Captain Robert Gray to 1849.

The Science of a New Life. By John Cowan, M. D. New York: Cowan & Co. 1870. 8vo, cloth; pp. 405.

This book is a plain, out-spoken treatise on those matters, to a great extent, of which, through false modesty, many are unwilling to speak. It is dedicated "to all the married, but particularly to those who contemplate marriage."

It is, in our opinion, a mistaken idea on the part of parents and others to allow children to acquire the knowledge of the sexual relations from chance sources, for these sources are always impure. As to exactly how a child should receive the information, whether verbally or by proper books, we do not pretend to say; but we do think that the way generally followed leads too often to evil results. The sexual instinct is implanted in everybody, and makes itself known as surely as the body ripens. And as imagination forms a very large portion of life, we think it far better to have the subjects treated of plainly and publicly rather than to have them restrained to secret companions and to the debased imagination. We, therefore, welcome such a book as this, as one greatly needed. We have but glanced it through, but are strongly impressed with its value. The chapters on The Law of Continence, The Prevention of Conception and on Fœticide are especially profitable for reading at the present time. We commend it to our readers.

For this book, H. B. Crist is sole agent in this city. Orders can be left at the drug store, corner of Sixth and Howard streets, or at Charles Eaton's music store, 138 Montgomery street.

Oakland and Alameda Co. Directory.

This directory for 1870, compiled and published by Cook & Miller, has been laid on our table. It forms a very neat volume, and contains a mass of information on all matters of public importance, selected and printed in a style which shows the ability and excellent taste of the publishers. It gives due place to educational, industrial and progressive matter, and contains much of value for all who have interests in this section.

Alameda county takes rank among the wealthiest in California. According to the assessed value of the real and personal property within its limits, it ranks as third in importance; San Francisco standing first, Santa Clara second, Alameda third and Sacramento fourth. Its numerous towns and villages, its flouring mills, its manufactories and its varied and extensive industrial enterprises, all tell of its prosperity and bear testimony to the thrift and prosperity of the farmer. The population is made up of nearly all the industrial classes; but out of the 5,308 registered votes, 2,117 are farmers. The assessed valuation of property for the year ending April 1, 1870, is $11,074,294.

The city of Oakland has maintained a steady and healthy growth and her future is bright with promise. Numerous buildings have been erected within the past year, the City Hall has been built, although the interior work is not yet finished, the exercises of the State University have commenced, and the fine buildings projected at Berkeley are in process of erection. The number of young men in attendance at this institution is forty-two. There are many other matters of which we would fain speak had we space. We cannot conclude, however, without expressing the wish that San Francisco would follow the lead of our sister city in the manner of revising street grades, if no further.

* * *

Men Wanted.

We spoke some time since of the opportunity for laboring men in the interior. A correspondent writes us from Boise City, Idaho Territory, saying that there is plenty of chances for good workers, and the *Capital Chronicle*, published at that place, gives a number of instances, and has the following to the point:

> We believe we do not over-estimate a single man when we say that 10,000 more men can find lucrative employment by coming to Idaho. Mile after mile of ground has been prospected and found to pay well. At Clark's Ferry, on Snake river, there are accommodations for many; on Boise river, miles of ground remain not taken up, and the Basin will ask for hundreds of more men to work the ground in that locality. Besides our mines, we have our valleys, which need settlers. The upper Payette is, as yet, comparatively uninhabited, while plenty of claims on the upper Weiser are waiting for owners. This is not one-half the land we have, nor have we mentioned one-third of the ground ready to yield up its rich deposits if men will come and work them. Men wanted! Young man, with bone and sinew of a jackass, loafing around the street corners of large cities, and complaining of hard times, come to Idaho, pull off your coat, and go to work. Middle-aged man, if you would retrieve your fortune, come to Idaho, take a pick and shovel, and toss the mother earth around. If you want work, young man or old man, pack up your "duds" and come along. You can make from six to ten dollars a day in many places here in Idaho.

* * *

Mining in Wales, according to reports, is causing some excitement at present. In view of this, a correspondent of the London *Mining Journal* writes, as a caution to capitalists, that all the productive lead mines in that country are in the lower silurian or limestone formations, while none of those in the upper silurian have ever paid expenses.

* * *

Bessemer, well known for his steel process, has invented a plan for avoiding seasickness, by keeping the passengers in chambers which are suspended on the principle used with a ship's compass. English papers have taken advantage of the opportunity afforded for jokes and sarcasms.

Agriculture in the Mountains—What's the Matter, and the Remedy.

It is a mistaken idea that the large valleys and plains of California are the only localities in the State where agriculture can be made profitable. The fact is, that from the very western verge of the foothills, even up to the line where placer mining ceases to be valuable, there is scarcely a square mile of territory where some branches of farming may not be profitably carried on. Of course, the mountain lands should be judiciously set apart for such culture as their soil, topography and market facilities more particularly adapt them for. Grain, vegetables, fruits, grapes, the mulberry, corn, sorghum, hops, the sugar beet, the poppy and tea may all find a place for extended and profitable culture and a steady market, provided a judicious encouragement is extended to all the other resources hereinafter enumerated.

There are numerous valleys in every county in the State where the dairy business—the making of butter and cheese—for the best market in the world, can be profitably carried on. Some of these valleys are already thus occupied, and we have yet to learn of the first instance of failure, where the business has been judiciously managed. These valleys afford the best and most nutritious natural grasses, and abundant opportunities for raising roots to feed in connection with hay, when the grasses fail in the dry season, or when, in the higher localities, the ground is covered with snow in the winter.

Irrigation is much less needed there than in the valleys; and when needed is much more easily and cheaply obtained. The grape, when once brought into full bearing, in the mountains, *never* needs irrigation; and experience has fully proven that the best grape and the best wine *must* come from natural growth, without artificial irrigation. Not a single vineyard has been started in the mountains that has failed to prove a profitable investment.

In order to show that we have not overstated this matter of fruit growing, we append the official statistics of one of the smallest mining counties in the State, and one only second in point of mineral wealth. We copy from the Surveyor-General's report on the fruit production of Amador county, for 1869:

Apple trees, 32,400; cherry trees, 2,200; peach trees, 20,200; pear trees, 6,000; plum trees, 5,000; nectarine trees, 900; quince trees, 2,000; apricot trees, 1,900; fig trees, 1,100; lemon trees, 120; orange trees, 140; olive trees, 20; prune trees, 280; almond trees, 850; mulberry trees, 370; English walnut trees, 850.

The above extract will show persons at a distance, and unacquainted with our climate, the variety of fruits that can be raised in the very midst of one of the best mining regions in the State. And just here we may add that the mountain fruits of California are universally superior in both quality and flavor to that raised in the valleys.

On the hills, and in the still higher regions of the Sierras, may be found the finest sheep and goat ranges which the world can produce. Wool may there be raised in quantity sufficient to supply the entire demands of the country, and of qualities suited to every grade of manufacture, from the coarsest blanket that wraps the form of the "honest miner," to the finest cashmere which spreads its delicate folds over the shoulders of the gayest votary of fashion. Within these same mountains, and in every county thereof, may be found water-power sufficient to build up a dozen Lowells; but a mere moity of which would be required to manufacture all the wool that could be raised there. In addition to all these advantages, we have also within the same territory, the finest mineral region on the globe, and the one to which the world looks for its chief supply of the precious metals.

Where is the man who will venture to call in question any one of the propositions here stated? Yet, with all these advantages, lands in the mountains have no fixed value. Millions of acres may be obtained at Government rates, with a title good against all the world. In fact, with the exception of now and then a small patch of improved orchard, field, vineyard or town seat, almost the entire country can be taken up under our land possessory Act. There is also an immense extent of good valley land that is still open to the settler that prefers the plains to the mountains.

Why is this? Why do not the toiling, suffering millions of Europe rush to this land of plenty—this land literally flowing with the milk and honey of beneficient Nature? The reason is a simple one, and easily stated—We don't try to help ourselves. Why we *don't* try, how we *may* do it, and the *effect* of doing it, will be considered next week.

◆

The Overland Monthly for April has been received. A few of its articles are perhaps a little inferior to the general average, and one or two read as if the editor's pencil had been extensively used in cutting them down. We were naturally attracted by the title of "Russian Gold and Silver Mining," but were disappointed at finding so little about mining in the sketch, and we must likewise confess to a little disappointment in the "Pioneer of 1920," although he does make several good hits. Other articles, however, are healthy and vigorous, and in "Pacific Ocean Lines and Privileges" there is much of especial interest at the present time. As a whole, the Monthly is good, and if we have spoken rather disparagingly of one or two parts, it is only because we are so desirous of seeing the periodical maintain without faltering the prëeminent rank which it has obtained in the land.

◆

California Silk Manufacturing Co.—A delegation of the trustees of this incorporation are now visiting our prominent citizens and receiving names on the subscription list. We have faith in this enterprise. Such industries should be organized and carefully fostered on the Pacific coast to develop its resources and to afford lucrative return for labor and capital.

◆

The telegraph cable, for the line between Bombay and Suez, had arrived in the third week of January at Bombay, having been brought by the Great Eastern and the Chiltern, and was to be laid, commencing about the first of February.

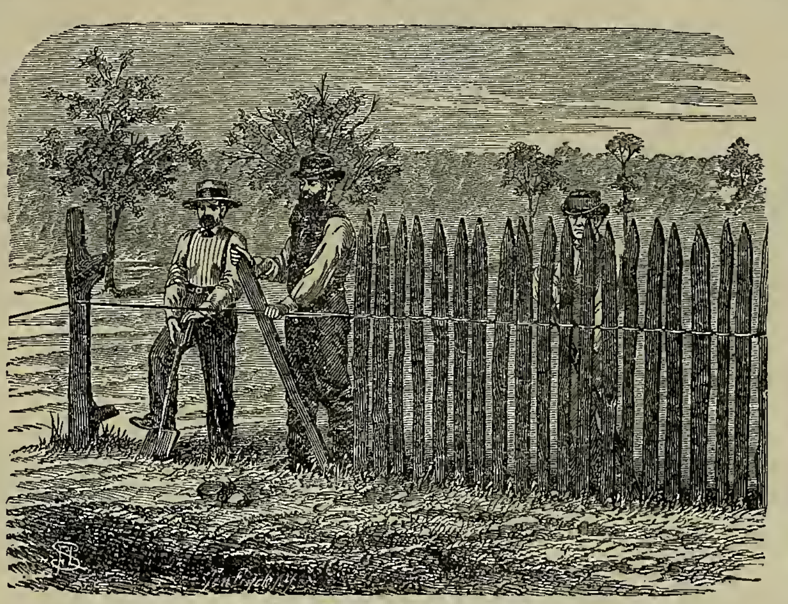
◆

Coal.—The total amount of coal consumed in the United States, in 1869, was 29,839,014 tons; in England, in 1868, 103,141,157 tons.

Improved Wire and Picket Fence.

The fence question has been exciting considerable discussion of late, and the acts of our Legislature on this subject have been spoken of by us at different times. In this connection it is of great interest to know what kind of surrounding is the best and cheapest for those who are obliged to fence in their land; and we give an illustration of an effective and comparatively inexpensive apparatus invented within the past year for this purpose.

This consists simply in setting posts at intervals of twenty or thirty feet, drawing two wires through holes in these posts, leaving them slack along the line for the insertion of the pickets. The wires are fastened by being wound around the first and last post of the section of fence to be constructed. They are then tightened by laying on the slack between the posts the pickets distributed along the line, one end of these resting on the ground while the other rests against the wire, as many being used in a bunch as may tighten the wire sufficiently; or any other method may be used. Then a shallow trench is dug between the posts and the butt of the palings set in this, while the tops are placed between the wires, as shown in the cut, these being crossed between each picket. As fast as the pickets are in place their lower ends are held by filling in and packing the earth in the trench. Should the wires become slack, they can be readily tightened by simply putting a twist in them, using a pair of palings for the purpose, turning them in opposite directions. The pickets need only be set from four to eight inches in the ground, according to the character of the soil. When stones are plenty they can take the place of a trench.



DAVIS' IMPROVED PATENT FENCE.

The engraving represents a rude farm fence made with split palings, and intended for use where economy is of more importance than mere appearance. But by using sawed palings of equal width it can be made very tasteful, and any form of wood or metal pickets may be used, to suit the builder.

In regard to the strength and effectiveness of the fence, it is claimed that it is impassable to all domestic animals; for the pickets cannot be crowded apart, and it can be passed only by either burrowing under or climbing over it. The pickets take the strain off the posts, each one being, in fact, itself a post, and as each is self-sustaining, the breaking of one panel, by some extraordinarily violent shock, does not overthrow the remaining portions. Where the fence has been used it has stood uninjured either by man or beast, since first put up.

The best wire is No. 10 annealed, the same kind as used for telegraph lines, which can be very easily repaired in case of an accidental break.

The fence is very cheap. The actual expense of a complete farm fence with top-sharpened split palings, and with the butts coated with tar or petroleum, is, in Virginia, where the patentee resides and first introduced his invention, less than fifty cents per rod. It can be built very rapidly, and three men can easily put up 600 yards in a day.

The economy in lumber is a very important item on this coast, and it can easily be seen how a great saving in this item is effected by the construction. Almost any kind of wood can be used by saturating the butts in hot tar or petroleum before inserting in the ground; but that protection is not needed for such wood as the cedar, cypress or redwood of California and Oregon.

The late war caused the destruction of all the fences in the country visited by the contending armies, and, in replacing them, the utmost economy, compatible with the proper strength and durability, was necessary. This condition of affairs gave rise to the invention of this construction, which certainly seems to be most valuable to the farmer who is obliged to protect his crops against the intrusion of animals.

Persons desiring further information with regard to the fence, or the purchase of State or county rights, can obtain the same by addressing the patentee, P. Davis, of Newport News, Virginia.

◆

Timber for mining purposes is growing more scarce every year, in many parts of the mineral regions. This fact should encourage the growth and care of trees suitable for such purposes, in localities where such scarcity may be noticed or apprehended. The Grass Valley *Union* suggests the planting of the locust and ailanthus—trees which grow rapidly and make good timber and fuel. A grove of such trees in any place where timber is scarce, will have a money value from the start, which value will increase at a more rapid ratio than any ordinary interest rate. In planting trees for timber, nut-bearing trees should not be forgotten, as they will have double value. Mr. Greeley is doing a good service for agriculture in urging upon the people of this country, everywhere, to devote more attention to planting and caring for our forest trees. A fortune awaits everyone who will plant a reasonably large tract of forest trees in any of the treeless regions of this State.

◆

Coal in China.—A. S. Bickmore lately read a paper on Chinese coal before the American Association. According to him, coal was mined in the mountains west of Pekin six centuries ago. There are immense quantities in the kingdom, and large mines in Manchuria and in the mountains west of the gulf of Lientang, in the province of Shensi and along the Yangta. The quality is rather inferior, and the best deposits still remain undisturbed. At the mine at Munti-kaw, which he visited, an adit has been driven a long distance, following the drift of the coal, up which the coal is brought on sleds by man-power, one Chinaman for each sled, the capacity of which is a bushel and a half. No machinery of any kind is used, nor are artificial means of ventilation known. In the north of China the coal is ground to dust and mixed with clay, that it may burn slowly.

◆

Oxide of manganese has been used in England for lining puddling furnaces. During the finishing of the metal, the manganese, it is said, separates in the form of silicate, carrying with it other impurities, as phosphorus and sulphur. This may be good for the iron, but bad, we should think, for the furnace.

The U. P. R. R. intend locating shops at Evanstown, 84 miles east of Ogden.

Fossils of California.

One of the most fascinating branches of geological investigation is the tracing back into remote periods the indications of the presence of man on the earth. Undoubted evidences of his great antiquity have been found, but we still know so little, comparatively, on the subject, that every fact which can throw any light on the matter is eagerly sought for. We bring together, in this article, notes of the discovery of fossils (human and animal) which have appeared, from time to time, as supplementary to previous articles of the kind.

Siskiyou County.—At Canal Gulch, near Yreka, in 1854, a tusk, probably of the mastodon, 11 feet 9 inches in length, and 24 inches in circumference at the base, was found imbedded in auriferous gravel at a depth of 20 feet.

Butte County.—In the vicinity of Oroville, some years ago, some stone relics were found, consisting of mortars and pestles, from 20 to 40 feet deep in auriferous gravel. Some also were found near Bidwell's Bar, at various depths, and at Junction Bar, north fork of the Feather river, 30 feet deep.

Nevada County.—In 1859, at Buckeye Hill, an arrow-head and stone mortar were found in auriferous gravel at a depth of 80 feet below the surface.

El Dorado County.—In 1864, fossil remains of the mammoth were found on Indian creek, 16 feet deep, in auriferous gravel; also at Indian Diggings, in 1869, in auriferous gravel, at a depth of 200 feet, after passing through various deposits. In 1855, stone mortars and other relics were found near Diamond Springs, in auriferous gravel, 100 feet below the surface.

Calaveras County.—At San Andreas, some years ago, in a gravel claim known as Marshall & Co., stone mortars were found in auriferous gravel at a depth of about 130 feet, under the following formations:

No. 1.	Coarse gravel	5 feet
" 2.	Sand and gravel	100 "
" 3.	Small beds of brownish gravel	3 "
" 4.	Cemented sand	4 "
" 5.	Bluish volcanic sand	15 "
" 6.	Auriferous gravel	6 "
	Total	133 feet

These relics were found in bed No. 6, and are evidently the work of human hands.

Mariposa County.—At Horse shoe Bend, in October, 1869, in some mining claims, a large deposit of fossil bones of the mastodon and other animals, were found. In the immediate vicinity of these were found 40 to 50 human skulls of a low type, and about the size of the skull of a child eight years old. The bones rapidly decayed after being uncovered, but the skulls remain sound.

Solano County.—At Bottle Hill, the fossil remains of the mastodon and horse have been found in beds of gravel with oyster shells and boulders of sandstone.

In 1867 an immense fossil tusk, 14 feet in length, and about 14 inches in diameter at the base, was found between Bottle Hill and Benicia.

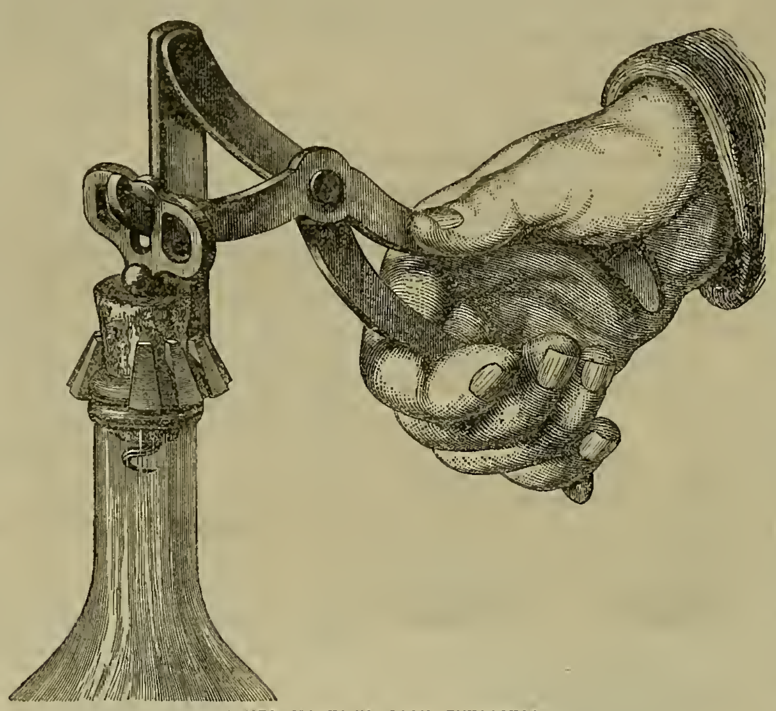
Tulare County.—In 1864, near Oil Springs, a few miles east of San Luis Obispo, fossil remains of the elephant and of other smaller animals were found.

◆

We are informed that the Pacific Stone Company, owning the Ransome patents in California, have made an engagement with one of the patentees, Mr. Ernest Leslie Ransome, of England, to take charge of the opening of their new works in this city, and the gentleman named will arrive about the first of July next. The company propose to manufacture building-stone, made earthquake-proof by interlocking each stone with that around it, by means of a tongue or bead and corresponding groove. Blocks so made cannot be displaced when laid in the wall, and can be manufactured as cheaply as plain blocks.

Morton's Cork Extractor.

This is a simple contrivance for extracting corks from bottles without the exertion required by the use of the common corkscrew, and without any risk of cutting the hands of the operator. It consists of three bars, one of which has, at its lower end, a socket, which is placed around the nose of the bottle, while the other end is pivoted on a second bar. The second and third bars are pivoted near their center, and the third has, at one end, a hook. To remove a cork, the screw is turned down in it to the handle, the socket placed around the neck of the bottle, the hooked end of the third bar attached to the corkscrew, as shown in the cut, and then by simply bringing the outer ends of the lever together the cork is drawn with ease and without shaking up the contents of the bottle. The screw is made of the best cast steel and the levers of malleable iron; hence it is a durable contrivance, which many will find exceedingly convenient. For further particulars address James Morton, No. 407 Cherry street, Philadelphia, Penn.



JAMES MORTON'S CORK EXTRACTOR.

◆

Hardware and Metal Trades Directory.—Next spring Messrs. Symonds, Wentworth & Co., No. 19 Central street, Boston, Mass., propose issuing a directory of the iron, steel, hardware and metal trades and their collateral branches of business, of dealers and manufacturers, and of all articles made from the baser metals, in the United States and in Canada. The information is to be arranged by States, giving cities and towns in alphabetical order and classified under business headings. The valuable addition of a copious index will not be forgotten. Such a book will, of course, have a most extensive circulation, and, if complete, as the publishers intend, will be invaluable to the trade, and exceedingly useful to all business men for reference. Persons desirous of advertising can address as above.

◆

Australian Gold Mining.—Melbourne papers speak of the rush to Berlin and of some rich claims which have been made, and large gold nuggets found. In New Zealand the gold fields show no exhaustion, while fresh ground is being continually discovered. In several districts in Victoria new discoveries in the old gold fields have caused great excitement. In Auckland province, valuable ledges have lately been found, but the wild speculations some months ago render it difficult to raise capital.

Our Home Industries.

Manufacture of Leather Belting.

There is nothing like leather, say the solid leather dealers of Boston, and their remark has passed into a proverb. Certainly this article performs the most varied and useful services, and is one of the most important for all classes of people. One of the uses to which it is put is for belting for machinery; but in this respect there has always been considerable complaint among millmen. On account of the cost of properly preparing the leather, belt-makers are apt to put an inferior article into the market. Belt-leather, although quite strong when new, is too often found to become brittle and hard after use, as the result of improper treatment. It is, therefore, interesting to know how and where it can be obtained of a proper quality. As we happened, while passing through Brannan street this week, to visit

H. Royer's Belt Factory,

We propose to give our readers a description of the process of making a belt, which is well known as being of a very superior quality. Mr. Royer has been a long time in the business, and his workmanship is noted for its excellence. We may premise that he avoids at his works the use of chemicals, to which are due to a very great extent the imperfections of the article. It may likewise be stated that the hides of California and Texas are superior to those of any other State for this purpose.

Removing the Hair, Etc.

The raw hides are purchased of the butcher and immediately washed and cleaned in a tank of water. The trimmings, as heads, ears, etc., are removed, and, as these are useful for the manufacture of glue, they are sold to the glue factories in the city. After cleansing, it is first necessary to remove the hair. For this purpose lime is very generally used; but this is injurious to the leather and cannot be entirely removed, so that the quality of work thus prepared is always inferior. At this establishment the hair is removed simply by "sweating,"—that is, by hanging the hides for a time in a closed box, an efficient and harmless process. Then they are removed to a loft and dried, by suspending them in a current of air.

Fulling.

The hides, after this cleansing and depillatory process, are stiff and unmanageable. It is necessary to render them pliable before further use, and for this purpose they are removed to the fulling-room. Here they are moistened with water, and then passed through a machine invented for this purpose by Mr. Royer, and patented by him through the Scientific Press Agency. The action of this machine resembles the manual operation practiced by Indians and in countries, as Russia, where labor is cheap. Inside of a circle of iron bars is a shaft. The hide is doubled up and attached to this shaft at one end while the other is left unattached. The shaft revolves in one direction until the hide is wound up on it, then it is reversed until the hide gets wound up in the other direction, when it is reversed again, and so on. Thus the hide is thoroughly rubbed and doubled continually until it becomes soft and pliable, without having its texture injured in any way. After the hide has been treated thus for a time, it is removed and "stuffed" by rubbing it with a mixture of tallow and tar, and again passed through the machine. Again it is stuffed and treated a third time, and it has then reached the proper degree of softness and pliability.

Cutting the Belts.

The leather is now stretched crosswise on a bench, and then cut crosswise into strips of the proper width. Very often, elsewhere, these strips are cut lengthwise—that is, from the tail to the neck of the animal; but this is a faulty method. The animal's skin is thicker and tougher towards the rump than at the neck, and although longer strips are obtained in this direction, yet the strips vary, and long splices must be made to cover up the weaker parts. By cutting crosswise, a superior and more uniform belt is obtained.

After cutting the belts, they are stretched, dried, and again stretched, making, in all, three times in which they are subjected to this operation.

Splicing the Pieces.

The next step is to cut or scaff the ends where they are to be spliced. This is done by a simple machine which cuts off a slice of the required size, leaving a wedge-shaped end for splicing. Two strips are then taken, their scaffed ends (previously roughened a little with a knife) moistened with a cement and laid one on the other, and then put under a press for three or four minutes until they are united. In this way pieces are joined until a belt of perhaps a hundred feet is obtained, which is coiled up and allowed to remain until the cement is dried and the pieces quite firmly united. Then the splices are carefully riveted and the belts trimmed.

Double belts are made by cementing one such belt on another and riveting every two or three inches.

The parts of the hide, such as the belly, etc., which are too weak for belting, are cut into strings for lacing.

Remarks.

The desirable qualities of good belt leather are principally great longitudinal strength and pliability. Lime and oak bark are the cheapest agents for its manufacture, but not the best, for they diminish these qualities and give one which is not required; namely: the capacity to remain firm when fairly soaked in water. This is desirable for the sole of a boot or shoe, but a belt is expected to stand only accidental moisture and not to be spoiled by a thorough soaking.

The leather from Russia, Poland, and some of the adjoining countries, is well known for its unequalled hardness and durability. This results from its preparation. It is manufactured without lime or chemicals; fish-oil alone is used. It is tanned mechanically. At this establishment the same results are striven for, and the only deviation is the use of improved machines instead of manual labor. Th is the only factory in the country where leather is prepared in this way, and its increasing popularity is shown by the fac that the proprietor has been obliged to double the former capacity of his works.

Oil Cake Meal.
THE BEST FEED KNOWN
For Live Stock.

We desire to call attention to OIL CAKE MEAL, which we are now manufacturing. No description of feed so greatly promotes the health of animals as Oil Cake Meal, and we urgently request all engaged in the dairy business, raising and fattening stock, or wool-growing, to give it a trial, feeling confident that they will find it of very great value. By those who have used it thoroughly, ONE pound is pronounced to be equal to two pounds of Corn Meal; and in the U. S. Government Report of the Department of Agriculture for 1865 it stands in the following relation to other feeds as to the percentage of flesh produced from a hundred pounds of feed, viz: Indian Corn Meal, 11 pr ct.; Barley Meal, 13 pr ct.; Oat Meal, 18 pr ct.; Oil Cake Meal, 22 2-100 pr ct. For life-sustaining properties for all stock exposed to sudden changes of weather, or over-driving it has no equal.

FOR MILCH COWS it is particularly valuable, increasing the quantity of milk and improving its quality to a far greater extent than any other feed known. A suitable quantity for them at the commencement is one quart in the morning and one quart at night, either alone or mixed with any other food; generally mixed with the mash of bran, slops, roots, or cut feed of any kind. It will improve it to soak it for six or eight hours, the effect being to increase its bulk two or three times. The quantity can be increased gradually, according to the effect produced—ordinarily not exceeding three or four quarts per day.

FOR BEEF CATTLE it has fattening properties which cannot be found in any other feed—the beef always being more tender and juicy and of much finer quality than when fattened on any other feed; and no feed known will so quickly prepare animals for market as Oil Cake Meal.

FOR HORSES, a small quantity given daily promotes their health, and is especially valuable for them when chilled or injured from over-driving. It is one of the best remedies known for Horses subject to the Heaves or Rheumatism, and greatly increases the cleanliness, evenness and glossiness of the hair.

FOR SHEEP, there is no article of feed known that produces such fine mutton, or so promotes the growth of wool. A small quantity given to chilled Cattle or Sheep will keep them alive and greatly increase their warmth and vitality.

At present price ($28 per ton) it is the cheapest feed in market. It is now selling in New York at $42 per ton, gold; at $50 per ton in England, where it has been proven for a long time to be in every respect the most profitable feed known for stock of all kinds—one ton being fully equal to three tons of bran.

The increasing demand for this Meal from those on this coast by whom it has been thoroughly tested has induced us to increase our facilities for its manufacture, and we are now fully prepared to furnish it in quantities as may be desired. For sale by the Grain and Feed Dealers, and at the Manufactory, King street, near Third. All orders will receive prompt attention. Address—

Pacific Oil and Lead Works,
Nos. 3 and 5 Front street, San Francisco.

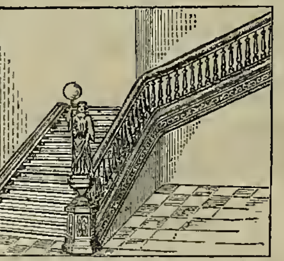
Depot, 320 Jackson Street.

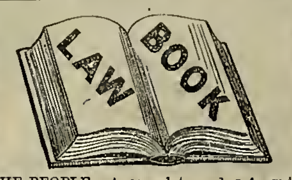
N. B.—We are prepared to furnish Bulk Packages to contractors on equally liberal terms.

HIBBERD, SANBORN & CO.,
STAIR BUILDERS.



South Point Mills, Berry Street,
Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.

Agents Wanted for Chamberlin's New



FOR THE PEOPLE.—A complete and safe guide for the correct transaction of every kind of business. *This is the only new work of the kind published for many years.* Cut out and return this advertisement to F. DEWING & CO., 542 California street, San Francisco. 12v20-13t

Patent Brokers.

WIESTER & CO.,

PATENT BROKERS,

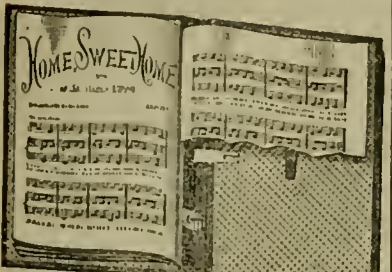
314 BUSH STREET,

SAN FRANCISCO.

Patents Bought and Sold on Commission.

For the benefit of those who live at a distance from he city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

BURGESS' PATENT PAPER FILE.



This is' a recent patent, and one of no ordinary merit. It is light and complete, yet costs but little. In all file-holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much time and trouble. This device is easily adjusted, is not liable to tear the paper, nor let it loose. This patent is also used in combination with covers for forming music folios. Musicians who have seen it, speak in the highest terms of its value. No person can fully appreciate the Paper File or Music Folio without seeing one.

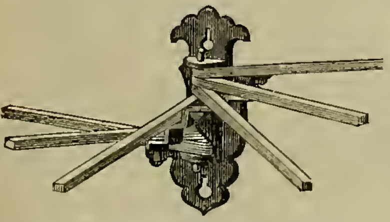
THE RANDALL RAKE.

Here is an article that we take pleasure in recommending This patent has been for some time on this coast, but for want of means has been allowed to remain comparatively quiet. It will require from four thousand to six thousand dollars to handle this invention successfully on the Pacific Coast, and we would advise any one with this amount of capital to look into the merits of this patent before embarking in other business. We cannot see why it will not eventually supersede all other horse rakes. It does its work completely and is easily operated. It is so constructed that the teeth play on an iron rod independently of each other, and therefore accommodate themselves to any surface. The inclination of the teeth to the surface prevents them from raking up sand and dust with the hay, and causes them to glide easily over the ground. The driver has a spring seat to sit upon, and a simple action of the foot is all that is necessary to drop the hay. A complete model can be seen at our office, or references can be had to parties who have them in use on their farms.

LIGHT.

A Lamp that makes its own gas and burns it. No chimneys are required. It is equal to the best coal gas, and costs fifty per cent. less. Agents get the lamps at manufacturer's prices. This new light can be seen at our office, 314 Bush street, San Francisco. The Right for the State of Oregon will be sold cheap.

HOTCHKISS' CLOTHES DRYER.



This Invention is for house use. It can be fastened to the wall with two screws, and removed without taking them out. When not in use the arms can be folded closely against the wall. Each arm has an iron brace to support it. This is really a "good thing in a family." County or State rights for this will be sold very low. Full particulars given on application.

A NEW SEED SOWER,

That can be attached to the Randall Rake at a cost of a few dollars, and is guaranteed to sow as well, if not better, than any other Sower in use.

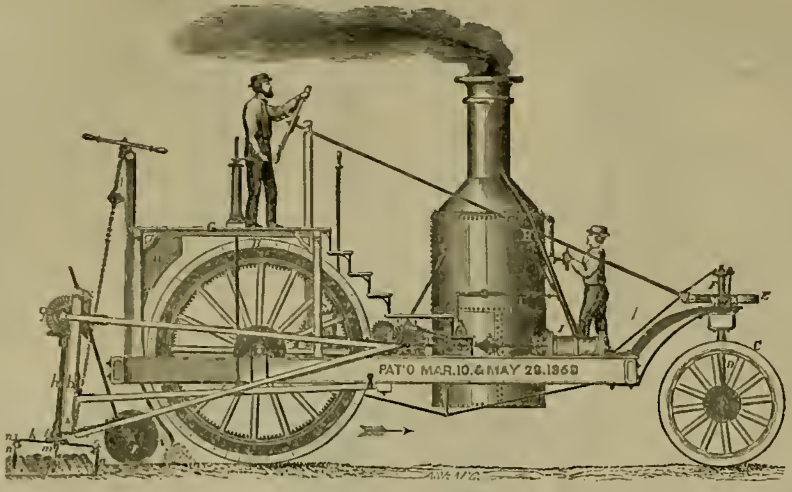
A neat and convenient CUPBOARD LATCH, tha answers equally well for single or double doors. It i suitable for Wardrobes, Wash-stands, Cupboards, etc.

A LOCAL AGENT wanted in every town on the P cific coast to sell patent goods

WIESTER & CO.,

11v20 314 Bush Street, San Francisco.

The Standish Patent California Steam Plow.



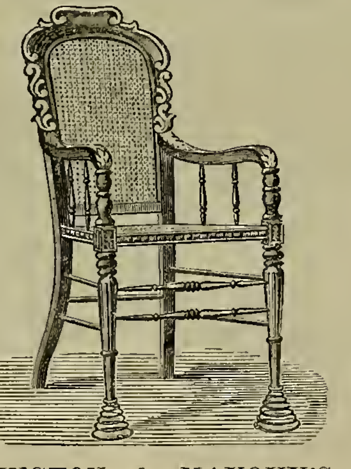
Capacity, from FIFTEEN to THIRTY Acres per day. The success of this invention for plowing large fields, is stablished beyond a doubt. Individuals, clubs, or companies desiring a more rapid and economical means of ultivating their farms, are invited to address, for the present, the inventor, PHILANDER H. STANDISH, care of Chas. F. Coffin, South Boston, Mass. He will soon return with a plow of improved construction.

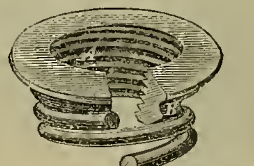
LOCAL AGENTS WANTED.

One reliable business man wanted in each and every town on the Pacific Coast to sell Patent Articles. We deal in none but first-class Patents, and each agent receives the exclusive right to sell in his town. Address

WIESTER & CO.,
314 Bush street, San Francisco.

PATENT CHAIR SPRING.





PURINGTON & MAYOUX'S PATENT, NOV. 30, 1869.

This is the best Chair Spring yet invented, and will undoubtedly supersede all other devices of the kind, as it is SIMPLER, CHEAPER, AND MORE DURABLE. As a simple article of comfort and ease, it has no superior, and only needs to be tried to commend itself to universal and lasting favor. The Springs seen attached to the front legs of the chair in the engraving enables the person sitting in the seat, with very little effort, to give themselves

A Gentle and Easy Rocking Motion.

And also to rest themselves by change of position, by a very slight movement. It renders a common chair, at a trifling expense, equal or superior, in many respects, to a rocking chair.

The advantage of this Spring over all others consists in the manner of attaching it to the chair by the simple turning of a nut, which nut is also securely, easily and quickly adjusted to the Spring in a manner impossible for it to become inadvertently detached. The engravings show the parts both detached and as adjusted to the chair.

The nut is made of metal, and is provided with a screw thread, so that it can be screwed to the leg of an ordinary chair; and instead of weakening and splitting the leg, as in the case where a hole is bored and a screw inserted to hold and attach the nut, this method strengthens it The nut can also be very quickly and easily put on or removed.

The ease and convenience in applying the spring to the nut is readily seen. The top of the nut is provided with a collar or shoulder, and also an incline groove around the outer surface, so that the smaller end of the pan can be screwed to the nut; and its top coil being brought firmly against the shoulder, all oscillation from side to side is prevented. When the nuts are taken off, the chair is uninjured in its original form.

THIS IS A CALIFORNIA INVENTION,

And a superior article is now being manufactured. For particulars apply to

A. MAYOUX, Marysville,

Or inquire of PAUL N. ROTH, No. 809 Montgomery street, San Francisco. 9v20-1amq4

Real Estate for Sale.

Valuable Ranch For Sale

NEAR HEALDSBURG.—In the fine valley of Russian River three and one-half miles south of Healdsburg, on the west side of the river, is now offered for sale a splendid farm of 260 acres of land (minus eight by twelve rods occupied by a good school house), 100 of which is of the richest of Russian River bottom, eighty acres of which is now in small grain, not surpassed by any in the State, five acres in bearing orchard of the choicest selections, fifteen acres plowed for corn, and the remaining 160 acres is rich, yet rolling timbered land, five acres vineyard of choice selection. The Dwelling has ten rooms, not yet finished, and supplied by a good spring of excellent water, and cost above $12,000. The barns and outhouses are in excellent condition. The title is "Fitch Grant," which is undisputed. The entire farm is inclosed, about half with a picket and half with a rail fence, both in good condition. The farming utensils which are offered with or in the sale of the farm, are as follows: Five plows, two harrows, two cultivators, one Buckeye reaper; also twenty head of hogs. There are 200 redwood trees within about five miles of the premises, and wood enough to supply all the demands of the place. It is well known by all parties who have resided for any length of time on this coast, that the climate of Russian River Valley is lovely, healthy and not surpassed by that of any other place in the United States.

The reason for selling is, that the owner is getting too old to cultivate a farm, and wishes to close up his business and live more retired. The place is a rare bargain at tha price asked for it.

For further particulars, apply to McLean & Hardy, Real Estate Agents, No. 338 Montgomery street, southeast corner of California street, San Francisco. 11v20

Valuable Stock Ranch For Sale

IN ALAMEDA COUNTY.

The attention of miners, "new-comers," or others, who wish to buy desirable real estate, is called to

675 ACRES

— OF —

Excellent Pasture, Grain, Garden

— AND —

ORCHARD LAND

FOR SALE AT A BARGAIN.

TERMS EASY.

This Ranch comprises hill and valley, is supplied with an abundance of good living water, is well fenced, buildings good, and is stocked with implements and animals. It is one of the best DAIRY RANCHES in the State, and is near the Railroad. Inquire of

JAS. F. CROSETT,
8v20-tf 304 Montgomery street, San Francisco.

Real Estate For Sale

In a romantic and desirable locality near the Railroad, in Alameda County. ONE HUNDRED AND TWENTY ACRES, in a body, of level, rich and superior soil, fit to produce everything. One of the finest gardens and nursery sites in the State. Rarely equaled as a homestead. For sale for $15,000—less than one-half its real value. Miners or city residents will find this a good opportunity to buy land cheap. A good cottage, with substantial outbuildings and fences, are upon the place, Call on

JAS. F. CROSETT,
8v20-tf 304 Montgomery street, San Francisco.

A Fine Country Residence

AND EXCELLENT FARM

Containing two hundred and eighty-five acres—seventy-five acres hill and two hundred and ten acres valley land—within one mile of the railroad, near Haywards, in Alameda County, for sale at a bargain, by the Administrator of the Estate. The house is a fine and substantial one, erected at a cost of $10,000, and magnificently located. An excellent orchard of six acres well-fenced fields, good barns, etc. Price, $35,000. For particulars, inquire soon of

JAS. F. CROSETT,
9v20-tf 304 Montgomery street, San Francisco.

GIANT CEMENT.
GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, Miners' Rubber Cement, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in tin cans only, with full directions. Take no other. Giant Cement and Miners' Rubber Cement are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco

MINERS' RUBBER CEMENT.
MINERS' RUBBER CEMENT.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœpaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

507 MECHANICAL MOVEMENTS.

PUBLISHED BY

DEWEY & CO.

LIST OF CONTENTS.

Æolipile.

Balance, Compensation: Barometer; Blower, Fan; Brake, Friction.

Cams; Capstans; Centrolinead; Clutches; Chasers; Clamps, bench and screw; Cock, four-way; Column, oscillating; Compasses, proportion; Counters of revolutions; Coupling, union; Crank—substitute for the, variable; Cranks, bell and compound; Cyclograph.

Differential Movements; Drag-link; Drill—Fiddle and Persian; Drills, Cramp; Drop; Drum and Rope; Driver, Pile; Dynamometers.

Eccentrics; Ejectors, Bilge; Ellipsograph. Engine, Disk; Engines—Rotary, Steam, Valve Gear for; Epicyclic Trains; Escapements.

Fountain, Hiero's; Fusees.

Gasometers; Gauge, Bisecting; Gauges, Pressure; Gear, Steering; Gearing—Bevel, Brush, Capstan, Conical, Crown, Eccentric, Elliptical, Face, Friction, Internal, Irregular, Multiple, Mutilated, Scroll, Sector, Spur, Step, Stud, Sun and Planet; Gearing—Variable, Worm; Governors; Guides; Gyroscope.

Hammers—Atmospheric, Bell, Compressed Air, Trip, Steam; Helicograph; Hook—Boat-detaching, Releasing; Hooks, Centrifugal Check; Hyperbolas, Instrument for Drawing.

Intermittent ovements.

Jack—Hydrostatic, Lifting; Joint—Ball and Socket, Bayonet, Universal.

Ladder—Folding, Self-Adjusting; Lazy-tongs; Level, Self-recording; Lever—Bell-crank or Elbow, Knee; Lewis; Link, Detachable Chain.

Machine—Bohnenberger's, Drilling, Polishing, Punching, Warp-dressing; Main, Flexible Water; Maintaining Power; eter—Gas (wet and dry), Water; ill—Barker's, Crushing, Tread, Wind; Miscellaneous ovements; otion— Alternating Traverse, Rocking, Self-reversing, Shuttle; Motions—Feed, Link, Parallel, Pump, Traverse, Variable Traverse.

Pantograph; Parabolas, Instrument for Drawing; Paradox, Mechanical; Pendulum, Conical; Pendulums, Compensation; Pinion—Lantern, Mutilated, Slotted, Two-toothed; Power, Horse; Presses, Hydrostatic; Propeller, Screw; Pulley—Expanding, Friction: Pulleys—Anti-friction Bearing for, Chain; Pump—Air, Balance, Bellows, Chain, Diaphragm, Steam-siphon; Pumps—Double-acting, Force, Lift, Rotary; Punching Machine.

Rack—Mangle, Mutilated; Racks and Pinions; Ram, Montgolfier's Water; Ratchets and Pawls: Regulator—Gas, Watch, Reversing Motion, Self; Revolver; Rollers, Oblique; Rolls—Anti-friction, Drawing, Feed; Rulers, Parallel.

Saw—Endless Band, Gig, Pendulum; Screw, Archimedes, Differential, Double Reversed, Micrometer; Screws—Endless, Right-and-left Hand; Sectors; See-saw; Shears; Stamps; Stand, Mirror; Stop—for Hoisting Apparatus, for Lantern Wheels, for Ratchet Wheels, for Spur Gear; Stops for Winding Watches.

Test, Friction; Throttle, Spinning; Toggle-joint; Tongs, Lifting; Trap, Steam: Treadles.

Water, Machines for Raising: Weir, Self-acting; Wheel Cam, Lantern, Persian, Pin, Rag, Sprocket, Steering, Waved; Wheels—Crown, Mangle, Paddle, Water; Windlass—Chinese, Friction; Windmills; Wipers.

This book is bound in cloth, and embraces 122 pages. The illustrations are plain, and each figure is clearly described on the page opposite to it. It is a low-priced book for its kind, and there are few persons who have to do with machinery, or are interested in understanding the science and principles of motion, who will not be benefitted and satisfied by its purchase.

A liberal discount made to the trade. Single copies, $1—sent postage free. Address orders,

DEWEY & CO.,
Patent Agents, San Francisco.

Illustrate your Inventions

IN THE SCIENTIFIC PRESS,

An illustrated journal of Mining, Farming, Mechanic Arts and Industries on the Pacific Coast It costs no more for a superior engraving by our experienced artists than is usually charged for a less perfect picture. If you wish to introduce a new invention properly before the public, the first steps in so doing are important ones. A full description and correct representation in the PRESS will go further and prove more quickly effective than any other means.

The fact that an illustration is admitted into our columns, guarantees the invention important consideration in the minds of thousands of the most intelligent readers—at home and abroad—who would not notice it so favorably or so thoroughly, if at all, when presented through an unreliable medium or indifferent source.

The model of an invention sent to us is sufficient for making a good engraving, Sometimes a photographic view is sufficient; but it is always best accompanied with drawings or a copy of the patent. A first-class illustration has proved to be one of the best and cheapest means of obtaining purchasers for a good machine or a valuable patent.

Cuts ordered for illustration are the property of the inventor who pays for them, and can generally be used for circulars, pamphlets, books, or other newspapers. The engravings to be seen in each issue of the SCIENTIFIC PRESS are a fair sample of the work of the artists who can always be found in our office.

DEWEY & CO.,
Publishers Scientific Press, American and Foreign Patent Agents, San Francisco.

SOMERSVILLE, CAL., August 25th, 186.

MESSRS. DEWEY & CO.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
GEO. HAWXHURST.

Kustel's Treatise on Concentration of All Kinds of Ores,

Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. Illustrated with 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. The Dressing.—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. The Separation.—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. Cleansing and Sizing Contrivances.—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. Rotary Sizers.—The Trommel or Drum; Cylindric Trommel: Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. Reduction of Ores.—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. Description of Batteries.—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. Details of a Battery.—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.

4. Speed, Curve and Order of Lifts.—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. The Discharge of Batteries.—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.

6. Feeding of Batteries.—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. Reduction by Rolling Mills.—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. Grinding.—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer: Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. Pans with Plane Mullers.—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. Pans with Conical Mullers—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.

11. Pans with Tractory-Conical Mullers.—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. Pans with Perpendicular Mullers.—The Centrifugal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. Concentration of Ore Grains (Jigging Stuff).—The Principle; The Jigging.

2. Movable Jiggers.—The Movable Jigger.

3. Stationary Jiggers.—Hydraulic Jigger; Petherick's Separator; Stationary Jigger.

4. Continual Jiggers.—Percussion Jigger, Setz Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.

5. Rotary Machines.—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.

B. Concentration of Ore Sands and Slimes.

6. Assorting of Sands.—The Labyrinth; Borlace's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. Feeding of Concentrator.—Feeding-Boxes; Stationary Feed-Box; Rotating Feeder.

8. Stationary Concentrators.—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.

9. Percussion Tables.—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Percussion Buddle.

10. Oscillating and Shaking Tables.—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.

11. Steady Moving Concentrators.—Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal-Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. Concentration of Gold Ores.—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. Concentration of Lead and other Ores.—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsenicials by Chlorination; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

PRICE, - - - - - $7.50 per copy.

Sent by mail, and sold wholcsale and retail by DEWEY & CO., publishers, office SCIENTIFIC PRESS, San Francisco.

Free Information for Inventors and Patentees.

Our Patent Office Circular, relating to U. S. and Foreign Patents, Caveats, Patent Laws, Rights of Inventors, Valuable Hints, Illustrated Mechanical Movements, etc., comprises 48 pamphlet pages, embracing the following

List of Contents:

Advancing Cases; Advantages, Important; Assignments, Forms, Cost, etc.; Caveats of what they Consist, Form of, Cost, how Filed effectively; Cost of Obtaining Patents; Confidential Advice; Copies of Patents Assignments, etc.; Copyrights; Dangers of Delay; Designs, Patents for; Engravings and Illustrations; Engine, Condensing-Beam—Illustrated; Extension of Patents; Foreign Patents—all Countries; Forign Inventors; Hints to Inventors; Government Fees, List of; Home Counsel; How to Obtain Patents—Steps Necessary; Hydrostatic Press—Illustrated; Interferences; Influence at Washington; Laws (U. S.) and Decisions Relating to Patents; Lathe, Engine—Illustrated; Letters Patent—of what they Consist; Library, Reports, Law Books; Locomotive Engine—Illustrated; Medicines or Compounds, Patent for; Mechanical Movements—Illustrated; Mining and Scientific Press Office; Processes, Patents for; Record of Pacific Coast Patents; Re-issues; Rejections—Cause and Remedy; Reports of Patent Office; Rights and Privileges of Inventors and Patentees; Saving of Time; Self-evident Facts; Selling Patent Rights; Springs, Various Kinds—Illustrated; Stamp Battery, Quartz—Illustrated; Telegraph, Patent Business by; Unsuccessful Applicants; Who can Obtain Letters Patents; What Claims can be Patented; Worthless Patents, Candid Reasoning.

This pamphlet will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed by

DEWEY & CO.,
U. S. and Foreign Patent Agents, Scientific Press Office, 414 Clay street, San Francisco.

A Word for Home Inventors.

OAKLAND, CAL., December 1, 1869.

MESSRS. DEWEY & CO.—Gentlemen: Permit us through your paper to return our earnest thanks for the prompt and successful manner in which you have conducted the various matters of business with the Patent Office committed to your care, more especially in securing for us our last valuable patent in the face of so many difficulties. Were it an ordinary case, in which you had simply secured us a patent, and for which services you had received a suitable equivalent, we should hardly consider you entitled to our thanks, however much we might feel gratified with your professional ability, uniform courtesy, or success. But this seems to be an exceptional case, and entitled to peculiar consideration. Without entering here into a detailed account of the legal complications and various discouraging circumstances you were obliged to contend with, suffice it to say, that your almost unhoped for success, securing, as you did, a full patent, despite all these obstacles, in so short a time, was scarcely less surprising than gratifying to us; and we feel it a pleasant duty to offer you this merited testimonial of our appreciation for the valuable services rendered, and to return you our sincere thanks for the same.

In closing, we would say to the public that this is entirely voluntary on our part, as Messrs. Dewey & Co. neither asked it at our hands, nor knew that we intended giving it. It is simply a free-will offering to professional skill and reliability, and a word of friendly counsel to others on this coast who may be possessed of valuable inventions on which they wish to secure patents. To all such our earnest advice is to place them at once in the hands of Dewey & Co., instead of being driven to it by a sad experience like our own.

Yours truly,
HUBERT BURGESS,
JAMES STRATTON.

SCIENTIFIC PRESS.—After January 1, 1870, the Mining and Scientific Press will resume its original title of Scientific Press, under which it was established in 1860, and will continue to be devoted to the improvement of the three great branches of industry—Mining, Farming, and Mechanic Arts—whose interests are intimately associated on this coast and are popularly and reliably represented by the Press. The subscription price is reduced to $4 per annum. Other charges will be at the lowest rates. This paper has been enlarged and improved in every department, and is now one of the best on this coast. Published by Dewey & Co., U. S. and Foreign Patent Agents, 414 Clay street, San Francisco.—*Tulare Times.*

"THE SCIENTIFIC PRESS" is the name now adopted by the publishers of the Mining and Scientific Press for their journal. It has been for many years, and still is, the leading mining journal of the United States. Every number contains a resume of the entire mining news of California, Nevada, Montana, Idaho, Colorado, and other mining States and Territories. Also, designs of new and useful inventions, with full descriptions. Its editorials are able, dignified, and comprehensive. It is just the paper that our mining friends require Terms, $4, coin, per annum. Address, Dewey & Co., 414 Clay street, San Francisco.—*Virginia City (Montana) Times, Feb.* 16.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

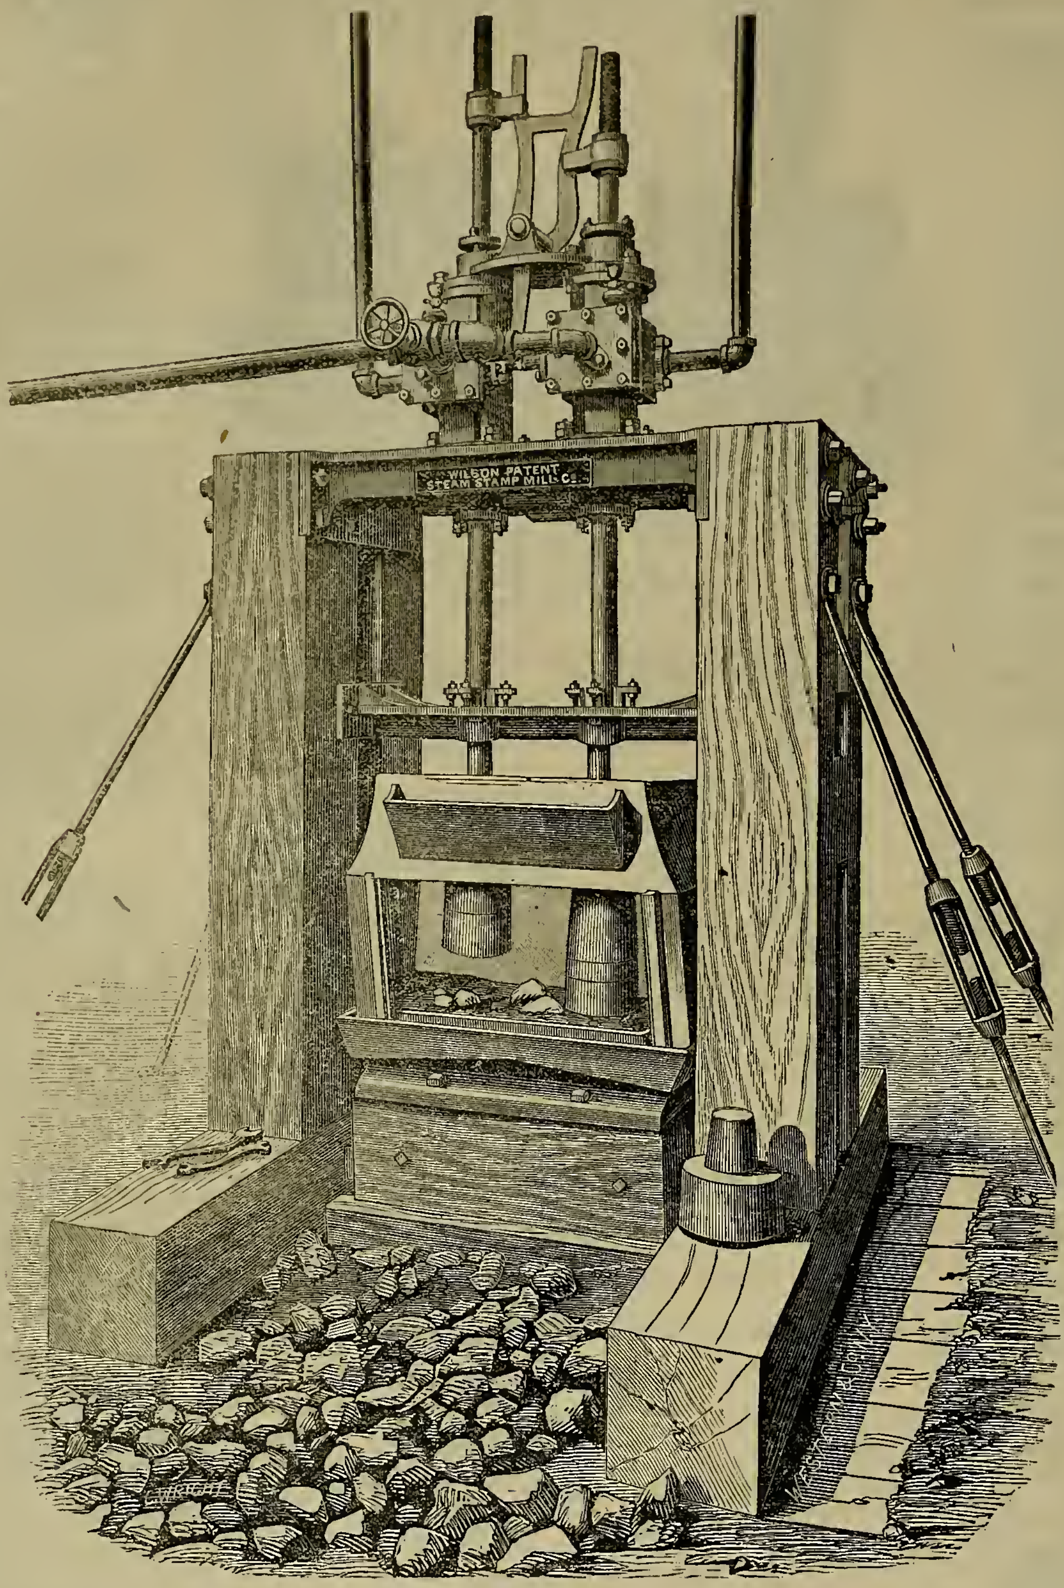
DEWEY & Co.,
Scientific Press Office, San Francisco.

SCIENTIFIC PRESS.—This paper is one of the most valuable published on the Pacific coast for miners, mechanics and farmers. It contains each week illustrations of new machinery, descriptions of new inventions and discoveries, information of scientific developments and mechanical progress, with valuable articles in relation to agricultural and farming interests. All claims of patents issued to inventors on this coast are published in this paper. We can recommend it to our citizens and hope Mr. Murray may meet with success in obtaining subscribers among them.—*Sonora Democrat*

SCIENTIFIC PRESS.—The Mining and Scientific Press, which has been a faithful exponent of the scientific, mechanical and industrial interests of our western coast, entered upon its twentieth volume on the first of January, and at the same time adopted the shorter and equally comprehensive title of Scientific Press. This journal has, for some time past, maintained a department specially devoted to agricultural matters, and has filled it with useful and interesting information.—*Contra Costa Gazette, Jan.*, 1870

WILSON'S STEAM STAMP MILL.



The above cut illustrates substantially the WILSON STEAM STAMP MILL. The great demand with which this Mill is meeting, the interest it has created, and the great desire of the mining public to know the particulars of this wonderful Mill, has induced the inventor to again illustrate it in the medium where it will receive the greatest circulation among those interested in the success of mining enterprises on this coast.

The Wilson Mill has now been in operation for two years in several of the Eastern States and Territories, and proved to be the most durable, efficient and economical Stamp Mill ever used. It takes steam direct, thereby dispensing with an engine or any intermediate power between it and the boiler. It does the work of about twenty stamps, crushing from twenty to forty tons per day. Is equally adapted for wet or dry crushing. It takes but a few days to put it in operation, as it is complete when it leaves the shop. Its whole weight is about 6,000 pounds. It is simple, and easily understood. Can be run by any one. Takes but little room, is not noisy, and requires from two to two and a half cords of wood for twenty-four hours. A twenty-horse boiler is more than sufficient to run it. These Mills will soon be in operation in several counties of this State and Nevada, as the manufacturer is engaged in making Mills for several mining companies in California and Nevada. One of these Mills can be seen in operation at the Pacific Iron Works, First street, San Francisco. All those intending to erect Stamp Mills should not fail to investigate the merits of the Wilson Steam Stamp Mill, for thousands of dollars can be saved in first cost, as well as an immense saving in the expense of crushing. For further particulars address,

FURMAN R. WILSON, San Francisco.

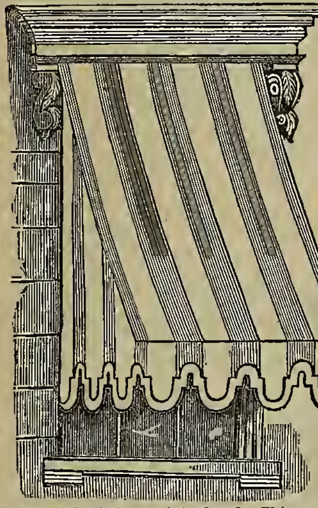
Newly-Improved Venetian Awning,

FOR STORES, HOTELS AND RESIDENCES.

COMFORT AND ELEGANCE COMBINED.



KEEPS COOL AND SHADY

Most useful article ever introduced. This awning can be applied to the outside of any window without marring the wood-work or detracting aught from the beauty of the architecture. By the appliance of the new Patent Slide, the awning is made to come low enough to shade the longest window to the bottom, thereby protecting everything in the room from the sun, allowing a free ingress of air through the open window and giving abundance of light. Manufactured from different kinds of goods, colors and stripes, according to price and fancy, by the sole proprietors and manufacturers, J. J. WITHERS & CO., Room No. 2, up stairs, 412 Pine street, San Francisco. 11v20-3m

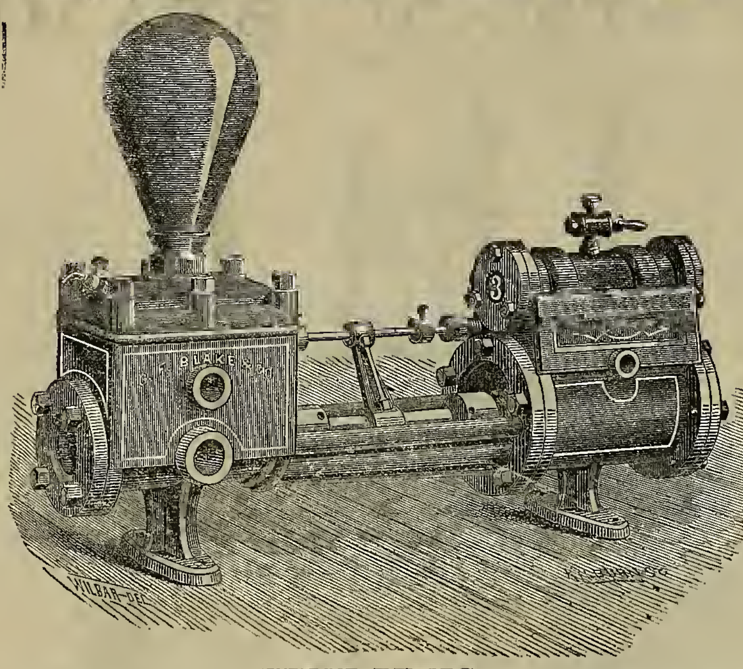
BLAKE'S PATENT STEAM PUMP.



THESE PUMPS

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—specially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

IT IS POSITIVE UNDER ANY PRESSURE. *May be run as slow or fast as may be desired.* Will discharge more water than any others of the same dimensions Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility. Will start at ANY point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. TWELVE DIFFERENT SIZES are made, capable of throwing from 1,000 to 180,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,
112 and 114 California Street, San Francisco.

☞ Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco; as being the Best Steam Pump on Exhibition.

This was no empty honor, as four of the principal Steam Pumps of the country were on Exhibition as competitors for the prize beside "The Blake," neither of which received any higher recognition than a diploma or certificate of merit.—*See Official Report of Awards.*

DR. ABORN,

Oculist, Aurist,
AND
CATARRH, THROAT
AND
Lung Physician.

No. 22 KEARNY STREET,
SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox, Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.
San Francisco (Cal.), Jan. 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.
San Jose (Cal.), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.

WILLIAM BEARDSLEE,
Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.

VINCENT MONATTI,
Corner of Dupont and Green streets.

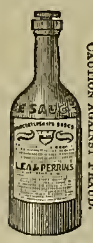
LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.



CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

One bottle will relieve you.

OFFI . 621 KEARRY STREET.

Agents Wanted in every City and Town.—Terms Liberal.

DR. S. GIRARD SMITH, 621 *Kearny street.*—Dear Sir: It would be hard for me to say how much I thank you for the benefit your ARAMIRACULAS has conferred on me in curing my RHEUMATISM. I was confined to my bed when I first commenced to take your medicine, and after using ONE BOTTLE I am now able to work as well as before. If you know anything about having that afflictive complaint, you must know how good it is to be cured. I will state to those who may not believe in your medicine, that they can be convinced by referring them to me. Very respectfully, yours,

ENON HARRIS,
Everard's Auction Rooms, 527 Kearny street.

Statement of an old and well-known Physician who has practiced extensively in Europe and America.

We must admit that the many systems of medicine by which we have attempted to heal the human body, and rid it of disease, from the science of ALLOPATHY down to HYDROPATHY, how little they have succeeded, time has abundantly shown by their number of failures. In the cure of RHEUMATISM, GOUT and NEURALGIA, Dr. S. Girard Smith has laid aside the old way and adopted a system, so simple, that I must admit, is so natural and direct, that it recommends itself to all who are suffering with the above diseases. And it challenges and defies all the old methods of treatment. Although I have been educated through a regular course, and graduated in Europe, I must acknowledge the right, and also give due credit for personal benefit received by the new system as practiced by DR. S. GIRARD SMITH, which induces me to bear this testimony to its merits, for the benefit of suffering humanity.

Reading for the Hour.

Eruption of a Volcano in Iceland.

Iceland has been visited many times with ruinous eruptions of its volcanoes, but that of Skaptar Jöknl in 1783 was the most frightful one of which there is record, for not only was it terrific in its immediate effects, but its direful results were felt long after throughout the whole of the island.

This eruption occurred in June. About the commencement of the month, repeated vibrations of the earth, which daily increased in force, gave warning to the people in the neighborhood of the wrath to come. On the ninth, columns of smoke arose, and rolling down towards the south darkened the land. The thunder muttered and growled ever in deeper and louder tones, jets of fire flashed through the smoke, and ashes were vomited forth. The heat melted snow and ice, and thereby the river Skapta was swollen to an unprecedented size. On the eleventh, the climax was reached, and the lava floods came pouring down the mountain side, rushing over hill and valley to plunge into the stream, where a hideous conflict raged between the fire and the water, till the latter was overcome and the molten fiery mass filled the channel and overran its banks. Ever reinforced from the glowing crater's mouth, the billows rushed on over the low country, poured into a lake, which it soon filled, divided into two streams and rushed ever on, in one direction overflowing ancient lava fields, in the other reëntering the Skapta, for fifty miles carrying death and desolation in its train. Another stream poured down to the river Hverfisfliot, fought and overcame the waters here, and in like manner rushed on for forty miles.

All through the fearful days of June and July, the lava poured out, and rocks and ashes were spread over the land. But finally they grew less and less, and at the end of August the mountain ceased to belch forth in its extreme violence. But the end was not yet. For a whole year the ashes and cinders spread over the land in a black cloud and covered the fertile fields with a destructive mantle. Vapors darkened the day, and the sulphurous fumes poisoned the waters and the land, so that the rivers and lakes were tainted with decaying fish and the herds of cattle perished in huge numbers. Starvation and disease came on the people. Their heads and limbs were swollen by the distemper, their gums loosened, their skin covered with foul sores, and blood oozed from their mouths and ears till death released them. Nearly 10,000 men and 230,000 domestic animals perished through this fearful eruption.

The farmer wonders how the resident of the city can live away from the green fields and the wild flowers, the birds and the pure air of the country; and the city man wonders how the farmer can live away from the conveniences and luxuries of the city, and both pity each other and congratulate themselves, and it is most fortunate that our nature is such that this is possible, else were we a most unfortunate set of beings?

A new coal deposit is announced as having been found in Stanislaus county. This exceedingly valuable article exists in a vein ten miles long and one and a half inches thick (at a depth of eight feet), according to the reports. We congratulate the finder and the county; but had we been the discoverers, we should have stretched our eyes until we could see at least two inches of it. Perhaps the length makes up for this.

A Royal Rascal let off.—Prince Pierre Bonaparte, who murdered Victor Noir, has been let off, in consideration of his high-toned family, with a fine of $5,000, which go to console Noir's family, and payment of costs of the suit.

How Waste Matter is Utilized.

In England a couple of *savans* have been attracting notice to the manner in which science has enabled man to make useful many things formerly, and now to a great extent, thrown away. *Chamber's Journal* gives a summary of what is at present very generally done.

Beautiful perfumes are produced from substances not merely trivial, but in some cases fetid and repulsive. Fusel oil, putrid cheese, gas-tar, and the drainage of cow-houses are thus transformed. Blue dyes are made from scraps of tin, old woolen rags, and the parings of horses' hoofs. Old iron hoops are employed in ink-making; bones as a source of phosphorus for tipping Congreve matches; the dregs of port wine for making Seidlitz powders; the washings of coal-tar for producing a flavoring condiment for *blanc mange*. Old woolen rags are the foundation of the prosperity of Dewsbury and Batly in Yorkshire, these musty, fusty, dusty, frouzy fragments being ground up into shoddy and mungo. Other relics of old woolen garments are made to yield flock for wall paper, padding for mattrasses, and Prussian blue for the color-makers. Chemicals are employed to destroy the cotton fibers in old worn-out balzarines, orleans, coburgs, and other mixed fabrics of ladies' dresses, and to liberate the woolen or worsted fibers for a new career of usefulness. Woolen rags, when even the shoddy-maker will have nothing to do with them, are choice materials for the farmer as manure. That bones are used for knife-handles we know very well; but it appears they are also used for bone-black by color and varnish-makers, for size by dyers and cloth finishers, and for manure by farmers. Horns and hoofs are a very magazine for useful products in the hands of the scientific chemist. Whalebone cuttings yield prussian blue; dogs' fat is (shamefully) made into sham cod-liver oil; wood-scourers' waste and washings reappear as beautiful stearine candles; bullocks' blood is used in refining sugar, in making animal charcoal, and in Turkey-red dyeing; ox-gall or bile is used by wool-scourers and by color-makers; fishes' eyes are used for buds for artificial flowers; bladders and intestines are made into air-tight coverings and into musical strings; and the odds and ends of leather and parchment-dressing are grist to the glue-maker; calves' and sheeps' feet yield an oil which is doctored up most fragrantly by the perfumer; stinking fish is always welcome as manure to the farmer; and a brown dye is extracted from those small bedroom acquaintances whom few of us like to talk about, and none like to see or to feel. At least fifty thousand tons of cotton-waste, the residue and sweeping of the mills, are annually utilized by being worked up into coarse sheeting, bed-covers, *papier mache*, and the commonest kinds of printing-paper. Seaweed is used as a material for paper, as a lining material for ceilings and walls, and as a source whence the chemist can obtain iodine. Various kinds of seed, when the oil has been squeezed out of them, are useful cattle-fatteners as oil-cake. Grape husks yield a beautiful black for choice kinds of ink; raisin stalks constitute a capital clarifying agent for vinegar; bran or corn-refuse is valuable in tanning, calico-printing, and tin-plate making; brewers' and distillers' grains are fattening food for cattle. Bread-raspings are in France sometimes used as a substitute for coffee, and as a tooth-powder; tan-pit refuse is valuable for the gardener's hot-house; damaged potatoes and rice and grain are made to yield starch; ground horse-chesnuts are not unknown to the makers of cheap maccaroni and vermicelli; cork-cuttings and scraps are eagerly sought for stuffing and for buoyant purposes; pea shells are used as a food for milch cows, and spirit may be distilled from them; sawdust is now applied in a prodigious number of ways, for making paper, distilling oxalic acid, smoking fish, cleaning jewelry, filling scent-bags, stuffing dolls, etc.; tobacco-ashes are made into tooth-powder; the coal-tar from gas-works is made to yield sulphate of ammonia, sal ammoniac, printers' ink, lampblack, disinfectants, naphtha, benzole, paraffin, and the magnificent series of aniline colors for dyeing and calico-printing; the sediments in wine casks is made into cream of tartar; old kicked-off horse-shoe nails yield the best of all iron for musket-barrels. As for the shops in which gold-workers, jewelers, and goldbeaters work, not only is the very dust on the floor precious, but a refiner will gladly give a new waistcoat or apron for an old one, for the sake of the auriferous particles thereby obtained.

Adoration of a Tooth and a Cloak.

The most solemn of Mussulman ceremonies, which is celebrated yearly on the 15th of Ramazan, took place on Saturday last, when the Sultan, the whole of the Ministers and all the great dignitaries of Church and State, proceeded to inspect and worship the personal relics of the Prophet. These venerated remains amount to seven, exclusive of several minor articles, such as arms, praying carpets, turbans, etc., either appertaining to him or to his immediate successors, the first four califs, Ebou, Bekr, Omer, Osman and Ali, generally distinguished as the "four friends." Of these seven articles, five are preserved in a chamber or chapel at the upper Seraglio, opening into a gallery northwest of the throne room, and fronting the beautiful octagonal pavilion called Erivan Kiosk, erected in honor of the capture of that place. Unless under accidental circumstances this chamber is not accessible to Christians, no matter what their rank. Indeed, no Moslems are ever admitted within its precincts, excepting the Sultan and palace Imans, and the guardians who keep watch, two by two, night and day.

On the 15th of Ramazan, however, the Sultan, attended by his court and the grand dignitaries of the Empire, enters to do homage. The whole of the relics are then uncovered and exposed with extraordinary pomp and solemnity. The remaining two personal relics consist of a tooth and a second mantle belonging to the Prophet. The one is preserved in the mausoleum of Sultan Mohammed II., and is shown to the public on the 27th Ramazan, the night of power or destiny. The second is at present in the possession of the second astrologer to the court, who resides in the immediate vicinity of Sultan Mohammed's mosque. The possessor of this latter relic, whose ancestors are said to have inherited and preserved it in direct succession from one of the Prophet's disciples, is honored with the title of sheikh of the holy mantle. It is exposed to public view during the last fifteen nights of Ramazan, and the owner reaps a rich annual harvest from the numerous presents brought to him by the multitude of devout persons, especially women, who throng to his house from sunset until midnight, during the last half of the festival.—*Levant Times.*

The Habits of Frogs and Toads.—There is a curious circumstance, which I should be glad to find any one able to explain, relative to the habits of frogs and toads in feeding. Most persons are aware that they live on insects, and that frogs in particular are great devourers of earthworms. Now, if you go out on a dewy evening, or still more, after dark, with a candle into a grass plot (in the heat of summer, especially after a shower), you will be likely to see many frogs and toads sitting still (if undisturbed,) and taking no notice of the numerous worms lying out, as their manner is, many of them quite close to their enemies. If you then catch a worm and throw it gently before a frog or toad, taking care not to frighten him, you will most likely see him make a set at it, like a dog at game, and come forward and devour it, though, perhaps, other worms lying around were even nearer to him.

Within ten minutes I have fed a frog in this manner with no less than three, and even four, of the largest sized earthworms, though all the time it took no notice of those uncaught lying before its eyes. The toad is slower in its motions, and (after earthworms, at least,) much less voracious than the frog. Each of them makes a most curious figure pinioning the worm with his fore feet to keep it straight and prevent it curling around the devourer's head. But how comes it that they do not—at least never that I say—make any attempt to seize the uncaught worms? Have they some instinct or reason which teaches them that the worms which are lying out have always, as is well known, their tails in their holes, into which they start back at the slightest alarm? The phenomenon is certainly curious, and the experiment is easily tried.—*Whately.*

An English gentleman, who is looking at California investments, desired to invest in a shave and a shampoo, for which he paid $1.25. He was offered land at that price per acre; and he complains that in San Francisco he has to pay the price of an acre of land for a shampoo.—*San Francisco Alta.*

The weight of the Great Pyramid, according to Sir John Herschel's calculations, is 12,760,000,000 pounds. According to Perring, the present quantity of masonry is 6,316,000 tons, or 82,110,000 cubic feet.

Fossil Birds in the United States.—Prof. O. C. Marsh says recent explorations have shown that fossil remains of birds are not wanting in the later formations of the United States, especially in the cretaceous and tertiary. Five specimens from the greensand of New Jersey are described in the *American Journal of Science and Arts*, by Prof. Marsh, who says that "if the interpretation given be correct, they prove the existence, in this country, even before the close of the Mesozoic, of an interesting and varied group of aquatic birds."

There is nothing that helps a man in his conduct through life more than a knowledge of his own characteristic weakness, which, guarded against, becomes his strength, as there is nothing tends more to the success of a man's talents than his knowing the limits of his faculties, which are thus concentrated on some practical object. One man can do but one thing well. Universal pretensions end in nothing.—*Ex.*

The Empress' prize of 10,000 francs is to be given, according to the report of the committee of the French Geographical Society, to M. de Lesseps, as the person who has accomplished the work most useful to the commercial relations of France by cutting the canal through the Isthmus of Suez.

While we have been rejoicing in pleasant days, and luxuriating on such vegetables as are now filling the markets, snow-storms have been raging at the East and tempests sweeping over the land.

SCIENTIFIC PRESS. Devoted to Mining, Farming and Mechanic Arts. Published weekly by Dewey & Co., San Francisco, at $4 a year.

For variety of interesting matter this journal compares favorably with any of our exchanges.

Coming as it does from the Pacific coast, and being made up almost entirety of original articles, it possesses an interest and a freshness peculiar to itself, and that is particularly attractive to us.

It gives us a sort of birds-eye view of the improvements and progress in the leading industrial pursuits on the western coast.

We should think every one who had spent a few years in California would consider this paper a necessity; and any one wishing to know of the industrial and scientific progress there will do well to subscribe for it.—*Journal of Agriculture, St. Louis, Mo.*

To Miners, Millmen and Metallurgists. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, $7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

Layres' Elements of Composition.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

Absolute Divorces legally obtained in New York, Indiana, Illinois and other States, for persons from any State or country, legal everywhere; desertion, drunkenness, non-support, etc., sufficient cause; no publicity; no charge until divorce obtained. Advice free. Business established fifteen years.
Address, M. HOUSE, Attorney,
14v20-3m No. 78 Nassau street, New York City.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24w

Treatment of Rebellious Silver Ores, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

Business Fortunes are often made easily, quickly and legitimately by Patent Rights. We advise both sellers and purchasers to patronize reliable agents only. Weister & Co., patent brokers, No. 314 Bush street, San Francisco, are one of the most honest, reliable firms in the United States. *

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

To Owners of Horses.

WATSON'S EUREKA SYSTEM.

A GREAT IMPROVEMENT IN SHOEING. Lame, tender or flat-footed horses put in good condition to travel over any cobble stone pavement in the City, in from one to four months. In nine cases out of ten, of what is called Lame Shoulder, Chest Founder and Corns, it is no more or less than the result of bad shoeing, therefore, this system, which is based on scientific principles and practice, remedies the above, and is particularly adapted to all horses working on hard or rough roads, as it keeps the feet sound in all seasons. Quarter crack in any stage cured. No bar shoes used after one or two months. Charges same as other shops. Watson's Eureka Shoeing Shop, Main street, between Mission and Howard. 14v20

WILD FRUIT (After Geo. C. Lambdin) 9¾ by 13	5 00
HARVEST (After B. B. G. Stone) 14¼ by 8⅛	5 00
SPRING TIME (After A. J. van Wyngaerdt) 14¼ by 8⅛	5 00
POINTER AND QUAIL (After Tait) 10 by 12	5 00
SPANIEL AND WOODCOCK (After Tait) 10 by 12	5 00
PLAYING MOTHER (After J. G. Brown) 9¾ by 12⅞	5 00
MORNING (After Rosa Bonheur) 12 by 17¾	5 00
EVENING (After Rosa Bonheur) 12 by 17¾	5 00

For an order of 10 new subscribers and $10, the sender will receive two of either of the above $5 premiums.

$2 PREMIUMS.

For an order for three new subscribers and $12, we will send either of the following:

PIPER AND NUT-CRACKERS (After Landseer)—Size 10 by 12⅞ inches	$2 00
VICTORY; or, The Remedy Worse than the Disease, 10 by 12⅛	2 00
AWAKENING (A Litter of Puppies) 8⅝ by 11⅞	2 00
THE TWINS, No. 1 (Lambs and Sheep) 10 by 11¾	2 00
THE TWINS, No. 2 (Lambs and Sheep) 10 by 11¾	2 00
SCOTCH TERRIERS AND PUPPIES, 8⅝ by 10⅞	2 00
NOT CAUGHT YET (After E. Landseer) 8 by 12	2 00
JUST CAUGHT (After Herring) 8 by 12⅛	2 00
THE FRIGHTENED DUCKLINGS, 10 by 12¾	2 00

$1 PREMIUMS.

For an order for two new subscriptions and $8, or for one subscription paid two years in advance, we will send either of the following Chromos, all of which are fine specimens of the art of oil color printing:

AUTUMN LEAVES—Maple—Size, 10½ by 14 inches	$1 00
AUTUMN LEAVES—Oak, 10½ by 14	1 00
THE WINTER WREN, 6½ by 8½	1 00
THE RUBY-CROWNED WREN, 6½ by 8½	1 00
THE SAVANNAH SPARROW, 6½ by 8½	1 00
THE BLUE THROATED BLUE WARBLER, 6½ by 8½	1 00
PIPER AND NUT-CRACKERS (After Landseer) 6¾ by 7⅞	1 00
MAY FLOWERS, 7⅜ by 9⅞	1 00
APPLE-BLOSSOMS, 7⅜ by 9⅞	1 00
VICTORY, 6½ by 7⅞	1 00

All these premiums will be sent prepaid so as to reach the owner within three weeks from the time the order for subscriptions are received at this office.

Prang's American Chromos excel all others. They are as lasting as real oil paintings, and retain the delight of the eye of their possessors during long acquaintance equally well.

Samples of these pictures may be seen at the gallery of Snow & Roos, No. 21 Kearny street.

Let the friends of the Press exert themselves a little in our favor, and secure one or more of these durable pictures as a pleasant reminder of their efforts in extending the cause of Scientific and Industrial Progress.

TO THE WORKING CLASS.—We are now prepared to furnish all classes with constant employment at home, the whole of the time or for the spare moments. Business new, light and profitable. Persons of either sex easily earn from 50c. to $5 per evening, and a proportional sum by devoting their whole time to the business. Boys and girls earn nearly as much as men. That all who see this notice may send their address and test the business, we make this unparalleled offer: To such as are not well satisfied, we will send $1 to pay for the trouble of writing. Full particulars, a valuable sample, which will do to commence work on, and a copy of *The People's Literary Companion*—one of the largest and best family newspapers published—all sent free by mail. Reader, if you want permanent, profitable work, address E. O. ALLEN & CO., Augusta, Maine. 5v20-3m

Ayer's
Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Secretary and General Agent....W. K. VAN ALEN.

Board of Trustees—Samuel Merritt, Michael Reese, Abraham Seligman, John B. Felton, Joseph Aron, Wm. H. Sharp, Henry Barroilhet.

THE SUTRO TUNNEL COMPANY.

Rights and Privileges.

The "SUTRO TUNNEL COMPANY," under a special Act of Congress of the United States, has the following rights and privileges:

1st—The Company owns a tract of mineral land adjacent to the Comstock Lode, in the State of Nevada, being the very heart and center of the richest silver region in the world, SEVEN MILES IN LENGTH BY FOUR THOUSAND FEET IN WIDTH, EMBRACING FIVE THOUSAND AND TWENTY ACRES.

2d—Also a Town Site at the mouth of the Tunnel, containing one thousand two hundred and eighty acres.

3d—The exclusive ownership of ALL mines discovered by the Tunnel.

4th—A royalty forever of TWO DOLLARS on each and every ton of ore extracted from any part of the Comstock Lode, and

5th—The right of appropriation of all the water carried off through the Tunnel.

Construction of the Tunnel.

In order to develop and render valuable every portion of this grant, the Company has commenced the construction of the Tunnel, which has already progressed five hundred feet, and is now being pushed day and night, at the rate of fifty feet per week.

The Tunnel is provided with a double-track railroad, and, with a ramified system of branches, to be constructed in every direction, will form a great highway under this argentiferous mountain range, furnishing extraordinary facilities for developing mines, cheap transportation, ventilation and drainage. It will eventually penetrate into the very heart of Mount Davidson, the center of this great silver region, under the summit of which it will pass at a perpendicular depth of three thousand four hundred and seventy-three feet.

Abandonment of the Mines.

The abandonment of the mines on the Comstock Lode, under the present expensive system of mining, is but a question of time; the completion of the Tunnel will give them a new lease of life, and will be the inauguration of a new era in mining. Instead of fifty steam engines, now necessary to pump the water and hoist the ore, none at all will be required. The water will run off through the Tunnel of its own accord; the ore will drop down by the laws of gravitation, and be transported over a short, straight, level railroad to the water power of Carson river, at less expense than it now costs to hoist it; fresh air will ascend to all parts of the mines, and through the connecting shafts, as through chimneys two thousand feet in height. In short, the simple laws of nature will be made to perform more effectually, at no cost at all, what is now accomplished by artificial means at an annual expense of millions of dollars

Reduced Cost of Mining.

The cost of mining and transportation will be so much reduced, and facilities for concentration at the mouth of the Tunnel created, as will make available many millions of tons of low-grade ore, which otherwise will forever remain buried in the bowels of the earth. It will permit the most extensive exploration on those portions of the Comstock Lode which have hitherto been unproductive.

Development of New Mines.

The development of new mines in this argentiferous belt is not a matter of speculation; it is one so well established by repeated examinations of the Company's grant, and by analogy with other mineral districts, that no doubt as to its immense value can be entertained.

The great silver deposits of the world are confined to isolated and limited localities, where either one great mother vein forms the nucleus of a system of parallel or cross veins and deposits, or where the latter occur by themselves, as has amply been illustrated by the explorations of centuries in the mines of Schemnitz, in Hungary, those of Clausthal, in the Harz, Friedberg, in Saxony, Cornwall, in England, Charnacillo, in Chile, Potosi, in Bolivia, Guanajuata and Zacatecas in Mexico—the three latter having for over three hundred years poured out their treasures, and yielded two thousand eight hundred millions of dollars, being more than one-half the silver ever produced in the world.

Sources of Revenue.

The whole country, from the mouth of the Tunnel, being of an argentiferous character, valuable developments may be made at any time during its progress. One single mine opened up may furnish the means for completion of the whole Tunnel.

The sale of town lots and mill sites on the Company's land will also yield considerable income; also that derived from the sale of water furnished by the Tunnel.

A very important revenue will be obtained from the contributions by the mines on the Comstock Lode, made compulsory by the Act of Congress already referred to, which makes the titles to these mines subject to the condition (expressed in all patents) that they shall pay to the Tunnel Company two dollars per ton, forever, on every ton of ore extracted from any portion of the mines. At the present rate of production of one thousand tons per day, this will yield to the Tunnel Company a daily income of two thousand dollars, exclusive of the charges for transportation of men, ore, rock, timbers, etc., estimated to amount to a similar sum.

Some idea of the income of the Tunnel Company from this source may be formed when it is considered that the increased facilities furnished by the Tunnel after its completion may triple the number of tons produced by these mines.

Benefits to the Country.

The influence which the successful completion of his great work will exercise upon all our mining interests can hardly be estimated. By securing the future productiveness of the most important mines in the world for a hundred years to come, by establishing their value at a greater depth than has yet been reached on any mine in the world, and by introducing a rational, permanent and economical system of mining, an unequalled impetus to, and confidence in all mining operations will be given, which must result in immense benefits to the whole nation, and especially to everybody interested in the welfare of the Pacific Coast.

An opportunity is now offered to all to become interested in this important and magnificent undertaking, under the following resolution:

"Resolved by the Board of Trustees, That twenty thousand shares of the full paid stock be sold at the office of the Company," where further particulars and printed circulars may be obtained.

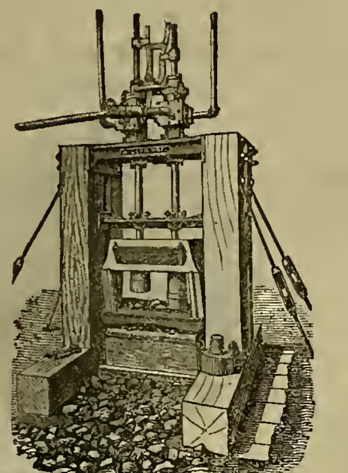
Machinery.

THE WILSON
Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

☞ The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

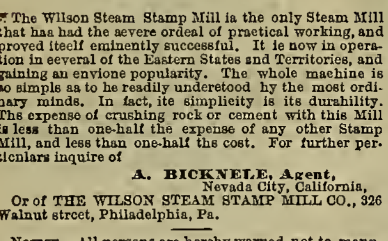
A. BICKNELL, Agent,
Nevada City, California,

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

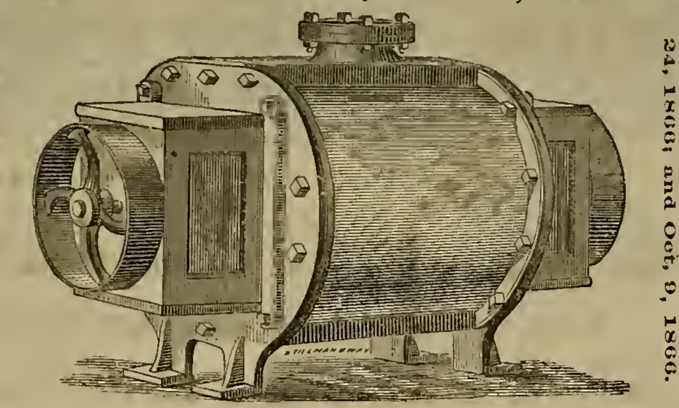
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

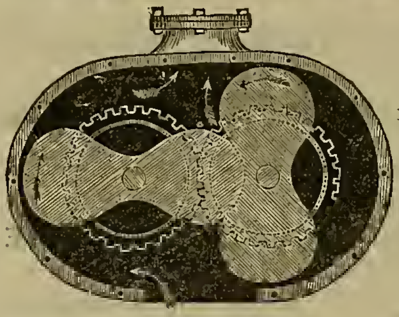
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.



REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

VARNEY'S
PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,
1v1 San Francisco.

FOR SALE.

A Ten-Stamp Quartz Mill,

NEW AND COMPLETE.

Situated in YANKEE BLADE DISTRICT, Reese River,
State of Nevada.

Engine, 12x24;
Boiler, 45 inches by 16 feet;
Ten Stamps of 680 pounds each;
Three Wheeler Pans;
Two Separators, etc.

The above Mill Fixtures will be sold cheap to a cash customer. Inquire of

R. T. VAN NORDEN,
10v20 509 Clay street, San Francisco.

A gentleman who knows says emphatically that the Scientific Press will not commend anything unless known to be good; and that money will not buy its endorsement of an unworthy object. That is high praise, but he did say it.—*The Pastor, Mayfield, March 15.*

To Sufferers from Rheumatism.

NOTICE OF REMOVAL.

MR. J. W. MAC,

Master of All Rheumatic Complaints, Weak and Painful Loins or Joints, Neuralgia and Tender Feet,

Is compelled, from his great success for the past five months in this city, to remove to more central and extensive premises,

128 KEARNY STREET,

Where he can be applied to daily for his wonderful (and may be termed magic) PLASTERS. No useless drugging. A discovery made by himself in New Zealand, and first personally tested by himself, having been a great sufferer. The innumerable testimonials awarded him for his marvelous cures since his arrival in this city, and his former services in New Zealand, Tasmania, and Sydney, New South Wales, are open for the strictest inquiry, and may be seen at the office of the "Daily Call," or at his rooms, Nos. 34, 35 and 36,

No. 128 Kearny Street, bet. Sutter and Post.

☞Office Hours, from 10 a.m. to 4 p.m., and from 7 to 9 p.m. 12v20-1m

THE GREAT MEDICAL DISCOVERY!

Dr. J. Walker's California

VINEGAR BITTERS.

More than 500,000 Persons

Bear testimony to their wonderful Curative Effects.

WHAT ARE THEY!

FOR FEMALE COMPLAINTS, whether in young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient. PIN, TAPE, and other WORMS, lurking in the system of so many thousands, are effectually destroyed and removed. ☞ Send for a Circular. ☜

They are not a vile

FANCY DRINK,

Made of Poor Rum, Whiskey, Proof Spirits, and Refuse Liquor, doctored, spiced, and sweetened to please the taste, called "Tonics," "Appetizers," "Restorers," etc., that lead the tippler on to drunkenness and ruin, but are a true Medicine, made from the native roots and herbs of California, free from all alcoholic stimulants. They are the GREAT BLOOD-PURIFIER and LIFE-GIVING PRINCIPLE, a perfect Renovator and Invigorator of the System, carrying off all poisonous matter, and restoring the blood to a healthy condition. No person can take these Bitters according to directions and remain long unwell.

They are a gentle Purgative as well as a Tonic, possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In Bilious, Remittent and Intermittent Fevers, these Bitters have no equal. For full directions, read carefully the circular around each bottle, printed in four languages—English, German, French and Spanish.

One Hundred Dollars will be given for an incurable case, provided the bones are not destroyed by mineral poisons or other means, and the vital organs wasted beyond the point of repair.

For Inflammatory and Chronic Rheumatism, and Gout, Dyspepsia or Indigestion, Bilious, Remittent and Intermittent Fevers, Diseases of the Blood, Liver, Kidneys and Bladder, these Bitters have been most successful. Such Diseases are caused by Vitiated Blood, which is generally produced by derangement of the Digestive Organs.

Cleanse the Vitiated Blood whenever you find its impurities bursting through the skin in Pimples, Eruptions or Sores; cleanse it when you find it obstructed and sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the Blood pure and the health of the system will follow.

The Scientific Press,

Devoted to Scientific and Mechanical Progress, Mining, Farming and Mechanic Arts, contains more valuable Reading Matter than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensive style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the new discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the Press, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to $4 a year, Jan. 1, 1870.

To Inventors on the Pacific Coast.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Engraving on Wood, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.

J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore.

GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe speoial ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology. and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

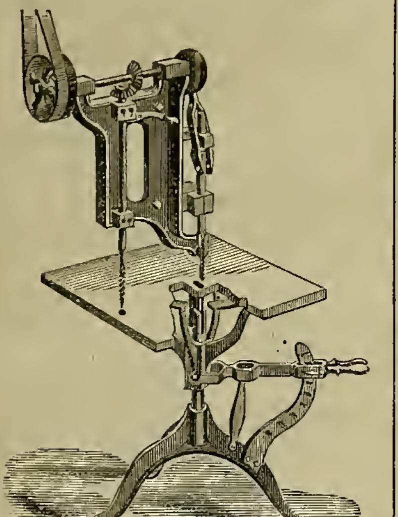
Improved Scroll Saw.

We gave in our issue of January 8th an illustration of an improved device for sawing scroll-work invented by a very clever mechanic of this city. This week we present our readers with another device by the same inventor, which is at once ingenious, effective and simple. The various parts of the machine can be readily understood from the engraving with need of but a brief description.

The manner of driving the band-saw and its upper connection with the shaft are sufficiently shown in the cut. This saw is short and is not fastened at the lower end, but simply inserted in a groove in a metal bar, which is attached to the bottom of the table. As shown in the illustration, the saw does not touch this bar, for the table is lowered, as is hereafter described. To the left of the saw is seen an auger, which is geared on to the driving shaft, and which can be thrown out of gear by lowering the handle of a lever attached near the upper end.



The table is fastened on a circular rim, which is supported by four arms cast on a block which slides up and down on a guide standing on three legs. By means of a lever attached to this block and pivoted on a bar connected with one of the legs, the table can be raised and lowered, while, by means of a spring near the handle of the lever, which catches in holes made in the arm, shown in the right hand lower corner of the cut, it can be held firmly at any requisite height.

Now when it is desired to saw out any pattern, this is placed on the table in the proper position under the auger, and by raising the table the preliminary hole is bored. The table is then lowered and the pattern moved, so that on re-raising it the saw works in the auger-hole, and by this motion the lower end of the saw comes into the groove for it in the bar below the table.

It is thus possible to saw out patterns with great ease and rapidity and with a great saving of labor in handling the article. The whole device is exceedingly simple; and there is not much danger of getting the several parts injured by working. It is invented by a practical mechanic, who has already devised quite a number of such machines. For further particulars address T. Stehins, 15 Fremont street, San Francisco.

* * *

Sale of an Owen's River Mine.—We received a call, a few days since, from Captain James Barrat, mining engineer, London, England. Captain B. has visited this State several times as agent for English capitalists, and is now here again in the same interest. We are pleased to state that his present visit has culminated in the purchase of a very extensive mining property, known as the Eclipse mine, and located at Independence, Owen's Valley, near Owen's Lake. The purchaser is in the interest of a mining association in London, known as the Eclipse Gold Mining Company, "limited."

We had occasion, several times, to refer to this mine, four or five years ago, while it was being developed by means of a small mill, under the supervision of Captain Joseph Eudy, of Grass Valley, and we are pleased to learn that Captain Eudy has been associated with Captain Barratt in the management of the property under its new proprietorship. Messrs. Balfour & Guthrie, of this city, will act as agents for the company in San Francisco. The most improved and substantial machinery will be at once placed in operation at the mine, which we understand comprises a heavy gold-bearing ledge, of well-developed value. We hope the new company will meet with the highest measure of success, and take rank with the best on the coast.

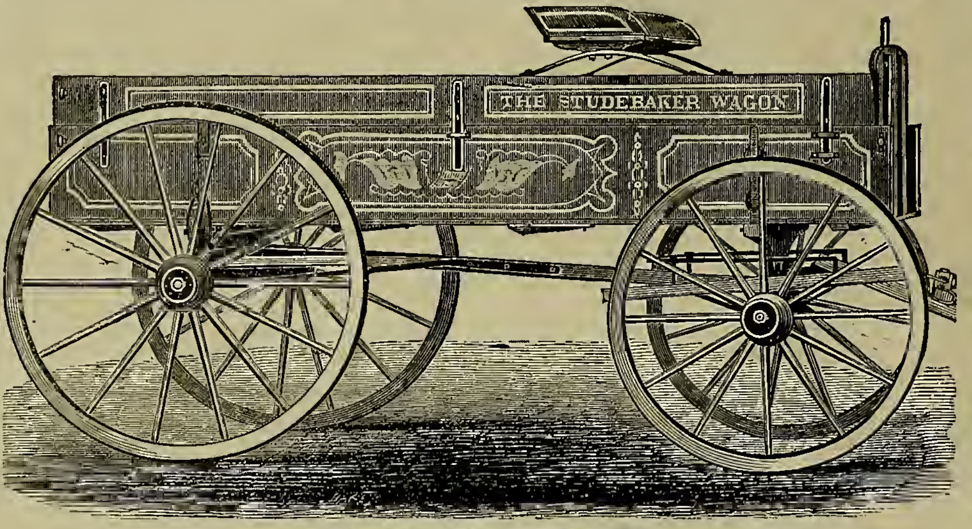
* * *

Owners of horses are referred to Watson's Eureka system of horse-shoeing in advertising columns. Mr. Watson claims that by this mode of cutting the foot and fitting the shoe, he is enabled to restore the foot to its original shape and healthy condition,

Farm Wagons.

The Pacific Railroad, "our great national highway," is bringing every day some new article for our market from the East. Among the later importations is one which is of more immediate interest to farmers and teamsters. We have all heard more or less of the noted Indiana wagons. One kind, the "Studebaker," has been brought to the coast by Messrs. Copeland & Defrees, of Sacramento.

The importation of these wagons has caused considérable talk among farmers and manufacturers here, and has created a lively competition on the coast; and for the benefit of those who are not acquainted with the details of this make, we publish an illustration in our present issue.



THE STUDEBAKER PATENT FARM WAGON.

The Studebaker wagon is manufactured at South Bend, Indiana, and the makers claim that it may well be considered one of the best, if not the best, of wagons. The agents claim, namely: the advantages of careful make by experienced mechanics and good material,—the best of Indiana timber,—which has been thoroughly seasoned under cover. They use the "slope-shoulder spoke," which is, they say, used in no other wagon. Moreover, they call especial attention to the fact that all the parts are so made that any part of one wagon, of the same size, will fit all the rest; and thus any piece which has been injured can easily be replaced; as they always keep on hand extra pieces.

Our farmers will now have the opportunity of deciding for themselves as to the qualities of different makes of wagons. The pioneer agents for this coast for the Studebaker wagon are Messrs. Copeland & Defrees, K street, between Seventh and Eighth, Sacramento, and to them any communications may be addressed for further information.

* * *

The Earthquakes in Germany are again coming into active operations. At Gross Gerau, in Hesse Darmstadt, between the 20th and 28th of February, ten distinct shocks were felt.

Our Foundries.

Work at the foundries is rather dull again. About a month ago the prospects seemed brighter, and orders began to come in; but this was only temporary. Still, as things improve, a better condition must come, only we must expect a gradual and not a sudden change.

The greater part of the work done now is in repairing and job-work. The Union Works are engaged on the steamers Lincoln and California, and on machinery for the Meadow Valley Mining Company. The Pacific Foundry is overhauling the steamers Santa Cruz and Clinton, making castings for Duncan's building on California street, and building Wilson's steam stamp mill, which is now being tested. Several orders for new mills have been received. The Fulton Foundry is engaged on an engine and boiler for the tannery at Benicia, machinery for the Giant Powder Company, castings for a malt-house at North Beach and for the San Francisco Chemical Works, besides various other small items. At the Vulcan, the boiler and machinery of the U. S. revenue steamer Wyanda has been thoroughly overhauled and repaired. Four new patent brick machines, with power, have been built for Mr. Blumenberg, for San Rafael. Two new cylinders, 16-inch bore and 5-foot stroke, complete, are being built for the Colorado Navigation Company. All the castings are made here for the lighthouse at Cape Mendocino; the base-plate is 20 feet 5 inches in diameter. The large anchor, the largest of the kind ever made, of the Lloyd & Stewart pattern, is finished; it weighs 1,674 pounds. For the blasting of Blossom Rock, eight tanks of heavy boiler plate, varying from 2¼ to 3½ feet in diameter, and from 5 to 8 feet long, have just been sent off. The house-front for Barrouillet's new building on Montgomery street is being made, and various job-work is being done. For different purposes, these works are turning out daily from five to six tons of castings. The Golden State Iron Works will be in operation shortly. Some of the best of the workmen have joined with the proprietors in a coöperative company, and the works are to be managed hereafter on the coöperative plan. The company has been incorporated, and the names of the trustees, etc., can be found in our list of incorporations.

* * *

Boston is to have another great musical festival. Two hundred instrumentalists and two thousand singers will take part.

Communications.

Mills and Mines of Colorado.—No. X.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Down towards the plains and fine mills from Empire and Georgetown is Mill City, a locality of few buildings, and having really a deserted appearance. As to the mill part, it being at the time 7° below zero, I did not take time to investigate. There are, I understand, several in the vicinity, none, however, in a prosperous condition.

Fall River.

Four miles further on, is Fall river, where comfortable quarters were obtained for the night. This is more of a mill locality than the above-mentioned place. A good hot fire being more comfortable than the state of weather outside, I concluded that those of whom I made inquiry would certainly tell the truth. From what I gathered of this locality, there are a number of mills in the vicinity, some of which are running, and, although not as dividend-paying institutions, yet hopeful, considering the condition of Colorado ores and their present system of working; it takes a great deal of hope to run most of the mines. Her ores are much more expensive to treat than those of California or Nevada. Her gold ores are not worked to exceed 30 per cent., and in some mills, with certain kinds, not to that amount. All her silver ores must be roasted to gain a high percentage, and thoroughly roasted at that. All ore is heavily loaded with either sulphur, lead, copper, antimony or iron, and too often all together.

Prices.

The only cheap item is labor, which they have reduced to $3 per day in currency. As I found prices for general articles, they were from 25 to 50 per cent. above even California rates, and yet Colorado is so much nearer to Chicago. But Colorado is a mining country, and all *mining* countries are able to pay the biggest kind of prices—and drag along slowly in consequence. This heavy pressure of prices ruins everybody, even those who obtain them, as it holds back progress with a curb-bit power. Considering the advantages Colorado has in location, as far as regards proximity to unbounded capital, a few days' ride from New York, and with St. Louis iron works brought within thirty-five miles by rail, as it will be in a few months, of the most active and valuable portion of her mining territory, I thought Colorado—before seeing it—a very inviting country; but, all things considered, I was rather disappointed. Some Coloradians may think I look at only one side of the question, but I endeavor to divest myself of all prejudice and look *facts* square in the face, and talk them out. There is, however, an atmosphere here that tends to prejudice—that feels uncomfortable for a stranger. One can hardly tell what it is, though he can feel it. It is not that frank, free, outspoken manner that exists among men of the same pursuit on this coast. "No Admittance" may convey the idea. I met, however, several very pleasant exceptions to what I consider the general rule.

Cold Weather.

But I am digressing. The next morning opened as cold as the day previous, and very windy. Meeting one of those enduring miners, who always takes "short cuts," whether he scales mountains or not, and he being bound to Central, "'cross the range," a jaunt of five miles to save five, I concluded to accompany him; so bundling up in a *pair* of California blankets we started. It was very cold—several degrees below zero—and the wind, seemingly, about 40° lower yet. In time, we gained the summit, which is about 10,000 feet high. We here found it blowing a gale, with snow and cold to rather an alarming degree. It was the roughest time I ever experienced.

The Rocky Mountains of Colorado are not miniature hills; they loom up in bold and solid heights, and, as in this instance, are at times the scenes of terrific storms. The whole mining region is above the average height of California. To give a more exact idea, the mountains range from 8,000 to 15,000 feet above the level of the sea.

Nevada, Central City and Black Hawk, as we look down upon them, with their innumerable smoke-stacks and buildings, have the appearance of a chaotic mass—a bee-hive of industry. I must not, however, enlarge on them in this letter, which is already sufficiently long. The weather of which I have spoken must be taken as an exceptional cold-snap, though about Empire and Georgetown it is cold enough during the winter to suit almost anyone, whethor from the State of Maine or from Texas.

* * *

California Marbles.

[Written for the Scientific Press.]

Although California contains an abundance of marble of great beauty and variety, most of that used in San Francisco is imported from Italy or New York. This fact may be attributed to the want of good roads and of cheap transportation. There are many localities in this State where quarries of marble are known to exist, but, with few exceptions, they remain undeveloped. A large belt of limestone traverses the State from north to south, between the foothills and the Sierras. This belt abounds in white or grayish, and, in numerous places, in beautifully variegated marble. The following list presents some of the localities where this article is found:

SHASTA COUNTY.—On McCloud river is a quite extensive quarry of gray and white marble of a good quality, and susceptible of a fine polish.

BUTTE COUNTY.—At Butte creek, about forty miles from Oroville, exist gray and white marbles of a good quality and in considerable quantity.

SOLANO COUNTY.—In the Pelevo Hills, a short distance north of the city of Suisun, is a handsome marble of various shades of brown and yellow beautifully blended in bands and threads, and susceptible of a high polish, which would make very fine ornamental work. This is about the only locality where this variety of marble has been found in this State.

NEVADA COUNTY.—About eight miles northeast of Nevada city, on South Yuba river, is an extensive quarry of marble of a dark variegated color.

PLACER COUNTY.—There is a quarry of nearly white marble on the Appleton ranch, about seven miles from Colfax, and about two miles from the railroad. In the mountains bordering on the Bear river, about two miles to the east of the town of Colfax, is a fine quarry of marble, which differs from all others found on this coast, being a dark gray with jet black venation, which, when polished, is very beautiful. The mantles in the new Bank of California are made of this marble.

EL DORADO COUNTY.—At Indian Diggings there is a large quarry of marble coarsely marked with gray and black, and some of which is almost white. It is very beautiful, and is susceptible of a high polish, which it retains well for years. A large number of monuments have been made of this marble.

AMADOR COUNTY.—In the vicinity of Fiddletown exists a quarry of marble of a pale-gray color and excellent quality in quite extensive amounts.

TUOLUMNE COUNTY.—On the road between Murphy's and Columbia, on the south fork of Stanislaus river, near Abbey's Ferry, about seventy miles from Stockton, there is marble nearly white, with pale-gray pencilings. The quality of the marble is fine, and has improved with the depth of the workings. Some of the handsomest monuments in the State are made of this marble; that erected to the memory of the late Senator Broderick, in the Lone Mountain Cemetery, at San Francisco, is a beautiful specimen. Blocks twenty feet square, without flaw or blemish, may be obtained from this quarry. On the south side of the road, between Gold Springs and Columbia, there are bodies of marble of almost a jetty blackness, perhaps colored by manganese. On Maletot Gulch, about one mile northeast of Columbia, there is a deposit of marble which, perhaps through the action of salts of iron, has been mottled with red, brown, yellow, blue and green spots, which would be beautiful for ornamental work. At Mormon Gulch, about three miles to the west of this, are masses of marble of very fine texture veined with pale green, perhaps by the action of chlorine.

All these marbles are of good quality and susceptible of a high polish, and will, in time, undoubtedly form a valuable commodity. There are numerous other localities in this State where marble is found, but has not been as yet developed, and which, perhaps, when examined, will be found to afford a still greater variety.

C. D. V.

The Gold Fields of Victoria.—No. 3.

[Written for the Scientific Press.]

It may not be known generally that when gold was discovered in California the present flourishing colony of Victoria had not been christened; that the great city of Melbourne was merely a village, with sheep grazing where to-day stand buildings which for magnificence would do credit to any city in any part of the world; that the chief pursuits of the colonists were tending sheep and herding cattle; that some of the colonists left these pursuits for the newly discovered gold fields of California—among these a Mr. Hargreaves, who, upon his arrival at the mines here, was so much struck by the similarity of formation and general appearance of the country to his own, that he told his companions of his confidence in his ability to find gold at home, and expressed a determination to return immediately. He returned and did discover gold, and although his claim to priority has been disputed, he is entitled to great credit for his sagacity.

Gold was practically discovered in 1851. The mines were rich, and population flocked from all quarters, and the colony, which in 1850 had been christened "Victoria," grew with a rapidity equalled only by California.

Early Predictions and their Non-fulfillment.

Mr. R. Brough Smyth, in his "Gold Fields and Mineral Districts of Victoria," published in 1869, says: "When the first important discovery of gold was made in Victoria, we were told by the highest authorities that the shallow alluvium would soon be exhausted, and when that time arrived we would be burthened with a dissolute population, who would bring ruin upon the country. When the quartz veins were opened and the riches they contain were ascertained, we were told that vein mining is never profitable beyond a depth of sixty or seventy feet, and that we should invest no capital in adventures which, the history of gold-mining has told us are never profitable. When the rich deep leads were traced under the basalt at Ballarat we were warned against being over sanguine, as the occurrence of such deposits was merely local. Fortunately for the colony these prophecies have not been fulfilled. We can point to several towns depending wholly on the mines for their support and inhabited by miners, where order and regular industry are conspicuous, where substantial and well conducted institutions for the relief of suffering and the spread of knowledge have been *originated and are supported by the miners*, and where municipal laws are more cheerfully obeyed than in any town in England. The shallow alluviums are not yet completely exhausted. Our quartz veins, notwithstanding the expense incident to the procuring of the vein-stuff from depths exceeding 700 feet, maintain their character, and may, because of their value and their great, horizontal and vertical extent, hereafter exceed in importance even the deep leads. The deep leads are not confined to the district of Ballarat, but extend over an area so extensive that it is impossible to say when the last of them will be opened."

Mining Statistics.

From the same authority, we quote the following statistics: Up to Dec. 31, 1868, 5,811,669 tons of quartz had been crushed, which yielded an average of 11½ dwt. ($11.50) per ton of 2,240 pounds. The number of gold mining companies (quartz and alluvial) registered in the several courts was 2,471; the number of shares, 7,431,205; the nominal capital, £24,431,205 ($122,156,025). The estimated value of all the claims in the Colony is, according to the information conveyed by the share lists and estimations, £8,869,504 ($44,347,520), more than one-third the nominal value. It is estimated that not more than ten per cent of the nominal capital has been paid up.

The length of water races constructed by the miners is 2,434 miles. They cost $1,551,350, or at the rate of about $637⅓ a mile. The total amount of revenue derived directly from the gold fields, in the shape of fees for gold licenses, miners' rights, business licenses, rents, etc., from 1851 to 1868 inclusive, is $26,057,329.77.

Gold Production.

The gross amount of gold exported, from the discovery in 1850 to Dec. 31, 1868, was 36,835,691¾ oz.; at $20 per oz., $736,713,835.

Taking the mean number of miners employed exclusively in getting gold during the 18 years and dividing the gold as here estimated, we find the average per man is £1,699 8s 3d, or £98 10s 4d ($492½) per annum. These figures are no true test of the success of individuals, but they show that gold mining is in the main a *profitable pursuit.*

The report of the Minister of Mines to Parliament shows the quantity of gold got respectively from alluvium and quartz during the first nine months of 1869 to be as follows: From alluvium, 701,829 ozs. 17 dwt; from quartz, 448,043 ozs. 1 dwt.; total, 1,149,873 ozs. He refers to the decline in the returns as distinctly traceable to two severe droughts, which impeded the years' operations. The tables of quartz crushing exhibit the usual diversity of yield, ranging from a few dwts. to upwards of 10 ozs. a ton.

The total number of miners employed on the 30th of September was given as 68,684, against 69,890 employed on the 30th of June, showing a decrease of 1,206, while there was an increase of 541 *quartz* miners.

At Ballarat, during the quarter ending Sept. 30th, there was a depression in mining matters, the returns of gold obtained and dividends paid show a falling off. The amount of gold was 53,139 ozs., the dividends $346,305—*over* 30 *per cent. on the produce.*

Dividends.

"The *Mining Record and Public Companies' Gazette* for June, 1869, showed that 67 quartz companies were dividend-paying against 69 which were non-dividend-paying, many of the latter being in a progressive state, while others had suspended dividends. The stock of many, of both classes, were quoted much above par, some of them hundreds per cent. One, the Clunes Clunes, at £475 for £1 paid.

The energetic company, "Bendigo," paid some $140,000 in dividends in one year, besides erecting machinery during the same period, and they have made only one sixpenny call! Latterly prospects dull. The nominal capital of this company is £120,000; shares, £5 each; amount paid up at 6d=£600=$3,000.

The Port Phillip and Colonial Co,

Was one of the earliest companies formed for quartz mining. This company own or work under lease five "reefs"—four of them ranging from 3 to 30 feet in width and one up to 150 feet. Their reduction works comprise 80 stamps of from 6 cwt. to 8 cwt., with a capacity to reduce and manipulate about 200 tons a day. They commenced operations in March, 1857, from which date to March, 1869, they reduced 470,839 tons of ore, which yielded an average of 10 dwts. 18 grs. per ton. The yield for 1857 averaged 1 oz. 12 dwt., from which it has steadily declined, and is now 6 dwts. or less per ton. This is one of the few companies formed in England for Australia, and it has, we believe, paid dividends all through, and the stock has always commanded a premium until after the payment of the dividend for the last six months of 1869, which, if we remember rightly, was only at the rate of 6 per cent., when the stock fell to ¼ below par. The capital is nominally $500,000. How much of that has been paid up is not stated.

The company have recently erected a new mill with 24 stamps of 8 cwt., which will increase their capacity for reduction to nearly 300 tons a day. Late reports of the company show the cost of extracting the ore to be about $2.50 a ton and of extracting the gold therefrom $1 to $1.25—total, say $3.50 a ton. This, we think, includes all charges, for wear and tear of machinery, dead work, etc.

The affairs of this company being conducted with the view to great economy, and the veins being large in size, the cost of extracting the ore may afford a fair criterion of the cost of extracting ore from other veins of similar size, while the statement as to their ability to make a profit from quartz yielding less than $2 a ton may be questioned or need explanation. M.

A POWERFUL MACHINE.—A combined shear, punch and upsetter, now manufactured in Connecticut, weighs only 350 pounds; but, operated by one man, will cut through cold iron ½ by 2¼ inches, with perfect ease, leaving a smooth face. Worked as a punch, it pierces cold iron with a smooth, clean hole, of any desired shape, without splitting the iron. By its aid wagon tires can be upset with one motion of the lever.

Mechanical Progress.

Another Advantage in Favor of Steel.

Engineering for March 11th,—after alluding to Mr. Bessemer's experiments which proved that in addition to the already admitted advantages of steel over iron, it had that of being acted upon uniformly over its whole surface, by sea-water and dilute acids, whereas iron was by the same treatment furrowed in such a manner as to be covered with points of weakness,—proceeds to detail some experiments recently made at the iron-works near St. Etienne, in France, upon the relative *quantity* of the corrosive action of sea-water upon iron and steel:

"Samples of plates were cut to exactly similar dimensions, and carefully weighed. These samples were plates of best wrought iron, of hard Bessemer steel, and of the softest kinds of Bessemer steel. These were immersed in sea-water. The plate was connected with one of the galvanometer wires, and the other, which carried a piece of platinum at the end, was immersed in the sea-water without touching the plate. This established a complete galvanic battery, of which the plate was the only variable element. The amount of electric force which was measurable by the galvanometer was, therefore, in direct proportion to the quantity of chemical action which took place between the sea-water and the plate. The experiments confirmed the fact that the corrosion of the softest kinds of steel containing more than one-third per cent. of carbon is more intense than that of wrought iron; but the corrosion of the softest kinds of steel containing from one-third per cent. of carbon downwards is *less* than that of wrought iron. In fact the amount of corrosion of different kinds of steel seems to follow the exact proportion of the percentage of carbon contained in the metal."

The Cut-off Valve of the Rider Engine.

We copy the following description from the *Journal of the Franklin Institute:* "On the *back* of the main valve, where the cut-off valve is fitted, the steam ports are *oblique*, and at opposite angles to each other. The cut-off valve is a sector of a cylinder, with its ends cut off obliquely in opposite directions; so that the extremities or acting ends respectively conform to the lines of a right and left hand screw of high pitch, corresponding to the obliquity or angle of the steam ports in the back of the main slide valve. This cut-off valve is fitted into a semi-cylindrical recess in the back of the main slide valve, and between the spiral openings. It is operated lengthways by a separate eccentric, to which it is attached in the usual manner, excepting that it has a swivel joint to permit its partial rotation. A portion of the valve stem is made square, and at this place is fitted a sector, engaging a rack on the lower portion of the governor spindle, so that as the governor rises or falls, the cut-off valve will partly rotate. Thus the cut-off valve is moved lengthways by the eccentric, and at the same time has imparted to it, by the governor, an adjusting motion on its axis."

A New Rail and Spike.—A tubular rail is the subject of a recent patent. The cavity is elliptical in shape, and the tread surfaces (it is reversible) are flat. It is placed upon a longitudinal sill which rests upon sleepers. A spike, patented by the same inventor, is in two parts. One of these, which is driven first, has transverse barbs in its face. The other is driven behind it, and forces the barbs to "take" or "bite," making it impossible to draw the first until the second is drawn. The accidental loosening of the latter is prevented by a depression which springs upon a corresponding elevation in the back of the first.

Grinding Tools.—"Plane irons should be ground to a bevel of about thirty-five degrees,—chisels and gouges to thirty. Turning chisels may sometimes run to an angle of forty-five. Molding tools, such as are used for ivory and for very hard wood, are made at from fifty to sixty degrees. Tools for working iron and steel are beveled at an inclination to the edge of from sixty to seventy degrees, and for cutting gun and similar metal range from eighty to ninety."

Photographing in Colors.

Wilhelm Grune writes the London *Photographic News* of some experiments made by him with chloride of silver. We quote: "My manner of proceeding is to employ a silver plate—prepared by means of the wet collodion process—and to place this in a solution of chloride of iron or chloride of copper, or in a mixture of permanganate of potash and hydrochloric acid. The silver quickly changes into white chloride of silver, which, after washing in water and drying, may easily be colored violet by diffused light. This is subsequently placed under colored glass and exposed in the sunlight, when the colors will be found to be reproduced with accuracy. I employ a camera used in the production of collodion positives, and, in lieu of the negative, place therein a highly colored transparent picture upon a black ground—such as a bunch of flowers, etc.—so that all light which enters the lens passes through the colored plate. With the different collodions and pyrogallic acid developers in general use plates may, in this manner, be obtained, which, after fixing and drying, show colors, which, if weak, are still very distinct, and which are visible either by transmitted or reflected light. By using collodion containing but a fourth part of the usual iodizing solution, and over-exposing the same, the results are even more marked. Pure bromide collodion also furnishes some very interesting results. By developing with an acid iron solution very definite colors may be obtained, the red and blue being especially striking."

President Barnard's Exposition Report.—We take the following from a notice of this valuable work in the *American Journal of Science and Arts* for March: "The concluding four chapters are occupied with the 'exact sciences' considered in their mechanical and practical relations. We read with wonder of the success with which measurements are carried to an exactness well nigh rivalling, to all intents, the mathematical itself,—of rods ascertained to a millionth of an inch in length, and of balances that perform to a twenty-millionth part of their burden. We are delighted to trace anew the progress by which the human eye has become enabled, through the perfection of object-glasses enormous in dimension, on the one hand, or of minute sizes on the other, to penetrate into the universe outwardly, and into the bosom of Nature inwardly. We are let into the surprising secret by which mechanism is made to render numerical computations with greater exactitude and with immeasurably greater promptness than the mental faculties of the computer himself could realize. We are instructed how to make sound itself a thing of visible undulations, and how to apply a measuring scale to their continuance. * * The report forms a resort where the engineer may obtain reassurance, the mechanic experience, the inventor impulse guidance and correction, and the man of intellect or of letters choice entertainment."

Automatic Boiler Feeder.—The feeder of M. Macabies consists,—says a late number of *Les Mondes*,—of two balloons (soda water reservoirs) suspended to the two ends of a walking-beam; so that as one rises the other falls; but so supported below by a similar and parallel walking-beam that each balloon, whether up or down, continues upright. Their action consists in *alternately* receiving a charge of water from the reservoir and a charge of steam, which discharges the water into the boiler. Whichever balloon is charged with water descends, and the other one charged with steam mounts. This oscillation opens one set of valves and shuts another, reversing all the connections and letting the steam-filled balloon now receive water, and the water-filled balloon now receive steam and deliver up its water. All these connections are established through the central pillar on which the walking-beam rides. And the pipe, which lets the water descend into the boiler and the steam ascend from it, has its mouth or lower end just beneath the normal water level in the boiler, so that the apparatus stops when the boiler *begins* to be too full.

The "Monarch."—This English iron-clad vessel, which brought home the remains of George Peabody, has in each of her two turrets two rifled guns weighing 25 tons each, with a bore of 12 inches, throwing conical chilled shot weighing 600 pounds. "The range is tremendous, and far exceeds that of any other ordnance now in use."

Scientific Progress.

Force and Will.

This was the theme of the address of Dr. B. A. Gould, the retiring President of the American Association, at the meeting in Salem, last August. As the address presents an ever interesting subject in a new form, we give a condensed abstract of it. After remarking that we must define force as that which is expended in producing or resisting motion, he quotes the following from Dr. Barnard:

"Organic changes are physical effects, and may be received without hesitation as the representative equivalent of physical forces expended. But sensation, will, emotion, passion, thought, are in no conceivable sense physical." * * Thought cannot be physical force, because it admits of no measure. * * A thing unsusceptible of measure cannot be a quantity, and a thing that is not even a quantity cannot be a force."

Dr. G. now proposes to ascend a grade higher, and consider that which guides and compels force, as force guides matter. He says: "There is an elegant experiment, in which the tension of a spring is made to produce heat by percussion, thus developing the current from a thermo-electric battery, which by successive modifications of its force exhibits heat, chemical action, magnetic attraction, and finally bends another spring; the same original force successively appearing in all these various manifestations until it is reëstablished in its primitive form. In such an experiment the imperfections of the apparatus would of course entail some loss at each successive step, and thus preclude the practical recovery of an available force equal to that expended in the original flexure of the spring. Could such an apparatus be constructed with theoretical perfection, it would represent an eternal circuit of force; and, like the frictionless pendulum in a vacuum, it would exhibit a perpetual motion, after the needful impulse had once been applied. In this inert apparatus no force whatever would have been embodied, yet qualities would have been implanted by design, which would compel an indestructible force, applied to it, to play the part of an unwilling Proteus. The inference seems unavoidable that force may be guided and controlled, compelled to exert itself in this or that shape, without the outlay of any other force for the purpose. If we assume muscular force to be co-equal with the expenditure of tissue, measurable alike by its transferred results and by the decomposition of this tissue, where and what is that power which lets loose or withholds this force, and whose action is attended by a conscious effort? It is the will,—a something which directs and controls force without expending it. * * In the same category with this agency, or energy, or influence, the vital principle would seem to belong,—directing forces while it neither expends nor consumes them. If in organic development force is consumed, disorganization without decomposition ought to evolve it. No comparison can be drawn between vitality and those molecular forces which build the crystal. Crystalline forms arise when the molecular attractions enjoy the freest scope, and their construction must be attended by an evolution of force, which ought to be recognizable by physical tests. Not only in that individuality which life confers and in the impossibility of insulating or transferring vitality, but also in its hereditary character and its apparent susceptibility of indefinite increase or diminution, the vital energy violates our fundamental conceptions of force. The indestructibilty of both matter and force implies a fixed coefficient of force for matter in equilibrium; but how great is the contrast offered in this respect by such energies as life and will! It is this class of energies which, controlling the forces of matter, guides and governs their modifications and transformations. It is this, moreover, which, inseparable from mind, is exerted by all conscious organism. The mystic play of co-equal, but to our senses, so dissimilar forces, and the equally recondite mutual action of the eye, the brain and the nerve, alike demand agencies transcending all our science, yet implicitly obeying physical laws. The highest manifestation of these agencies is in will. Thus the dictum of faith, that the universe exists only by virtue of the continued will of its Creator, represents a palpable scientific fact."

The "Nascent" State.

This term, applied to the condition of a substance at the moment it is separated from any combination, is pronounced by H. St. Claire Deville a "fiction" which is "useless, and consequently hurtful to science," inasmuch as it must necessarily be indefinite. We quote a few detached paragraphs from a paper by him which is translated for the *Journal of the Franklin Institute:* "A simple body is only characterized by the compounds which it is capable of furnishing, and not, as formerly, by certain invariable and specific properties. The great discoverers in modern science since Mitscherlich have proved that a simple body may present many allotropic states according to the phraseology of Berzelius. The number of these states is unlimited. Thus we call phosphorus a simple body, which, by combining with oxygen, forms phosphoric acid; but when you study phosphorus itself you see that it possesses various states; a certain number of properties constitute Schrotter's red phosphorus; another group constitute white phosphorus. If you take sulphur, of which so many states were observed before those of phosphorus, you recognize in the multiplicity of these different properties several sulphurs—the most convincing argument that could be furnished to the advocates of unity in the composition of matter. What do we mean by the *nascent state* of any body? Can we define this expression exactly? I think not. A body, the moment it comes out of combination, is free or is not free; it cannot be at the same time combined and uncombined, simple and compound; it cannot be *in the process* of birth. We only suppose a nascent state to lend to matter a system of properties arbitrarily assigned so as to explain facts which are not otherwise clear. * * In a preceding work I have shown that what we know of the difference of physical states of the same order no longer permits us to suppose the existence of sulphuric acid and of potash in the solution of sulphate of potash any more than it is to-day possible to confuse red phosphorus with white phosphorus, octohedral or prismatic sulphur and insoluble sulphur. Similar reasoning founded on the disengagement of heat produced by the contact of water with hydrochloric and nitric acid, and on the heat of contraction of these materials at the moment of mixing scarcely allows us to judge of the state of the acids in similar solutions. Since this state is unknown it is not reasonable to assume that it can change in contact with a fourth substance, so as to take, for an indefinitely short time, an equally unknown form, the nascent state."

Another Alloy of Ammonium.—We gave, in our last, Dr. Gallatin's demonstration that ammonium really existed in the alloy with mercury. He describes also, for the first time, an alloy of this metal with bismuth. A piece of sodium was dropped upon melted bismuth, and upon this alloy chloride of ammonium was dusted. Water was added in a fine quick stream. The bismuth swelled, appeared pasty, and congealed. Hydrogen escaped from the water, and an ammoniacal odor was perceived. The mass was then dried. If placed near the ear a crackling sound was heard,—and this for some days afterwards. This was shown to be due to the escape of ammonium from the bismuth.

Telegraphic Warning of Approaching Storms.—A bill passed both Houses of Congress in February, providing that meteorological observations be taken at the various military stations on the Atlantic coast, and in the interior of the continent, and that notice of the approach and force of storms be given, by telegraph, on the lakes and on the coast. While the bill was pending, letters were sent to the House of Representatives by several distinguished scientists, expressing their approval of the proposal, and suggesting the advantages which might be expected to result.

Affinity Between Birds and the Dinosaurian Reptiles.—Prof. Huxley has found further evidence of this affinity in the structure of the pelvic bones, and in other parts of the skeleton. In the course of a discussion upon the subject, Sir Roderick Murchison remarked that the progress of science was tending to break down the lines of demarcation between groups supposed to be distinct, rather than to authorize the creation of fresh divisions.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Items.—*Miner*, March 26th: Mr. McCarty, of the Good Hope mine, has leased the Pioneer mill with privilege of purchase. As work goes on, the lode seems to widen, and is now over eight feet thick. ....The jigging works of the Schenectady Co. are turning out regularly some very fine washed sulphurets....It is rumored that the Morning Star mine will soon be started up again.

Good Hope.—*Chronicle*, 26th: Last December the mine was sold to a Philadelphia Co., and on Monday last Supt. McCarty put men to work clearing out the tunnel. On the next day, upon removing some timbers that had been displaced by a cave, a fourteen-foot ledge of good ore was discovered.

AMADOR COUNTY.

Butte Ditch Extension.—*Ledger*, April 2d: This enterprise is at last fairly under way. It will be a bright day for us when it is completed, and the manner in which the work is being laid out shows that we shall not have to wait many months before reaping the benefit of an abundant supply of water on as rich mining ground as we have ever seen.

Kennedy Mine.—The difficulty was finally settled last Thursday, by deeding the property to the creditors, subject to a mortgage and two liens.

Clinton.—In the vicinity of this quiet little camp, considerable placer mining is being done. Fred Taber exhibited a specimen weighing an ounce, taken from one of the claims a few days ago.

BUTTE COUNTY.

Paulinville.—Cor. of Oroville *Record*, April 2d: The Armstrong Bros., in Irish ravine, have got an engine on their ledge.

EL DORADO COUNTY.

Grizzly Flat.—*Democrat*, April 2d: Melton & Morey cleaned up last week, from a run of 10 days of their five-stamp mill, $600.

Gold Dust.—There has been shipped from this place during the past week, through Wells, Fargo & Co., $10,950.

Georgetown.—Cor. of same: There is some excitement here over the discovery of very rich quartz seams by Sornherger, Lsne, Danes and Urey, on Hungry point, one mile southwest from town. Something near $400 has been taken out in a few days with a hand mortar. There seems to be new life springing up in quartz. Almost every miner is prospecting. At Georgia slide and Jones' hill the quartz mines are still paying well, and claims are opened that will last for years. At Volcanoville there is considerable prospecting going on. All we need at Georgetown is capital. Everything is favorable for cheap working. The Woodside mine is still filled with water, and the owners, being not able to erect machinery, have concluded to sell. Preparations are made to resume work on the Taylor mine. Some very rich ore is said to be in sight.

KLAMATH COUNTY.

Quartz.—Yreka *Union*, April 2d: Daggett & Reid, of the Black Bear quartz mine, on Salmon river, were in town last week. They report all things prosperous about Sawyer's Bar, and say that the Black Bear is running on as good rock as ever. Their new mine, the Klamath, also gives promise of equaling the Black Bear.

LOS ANGELES COUNTY.

Soledad.—*News*, March 26th: Yesterday, J. A. Hayward & Co. received 193 ounces of gold bullion, worth upwards of $3,200, the product of 22 days' run of the Eureka mill.

NEVADA COUNTY.

Mining Patent.—Grass Valley *Union*, March 30th: The patent from the United States to the Empire Co., conveying title to the lode and surface ground claimed, was received on Monday.

Struck the Ledge.—Same of April 3d: Some time ago the Mutual Co., at Graniteville, came to what looked like the end of the "Jim" ledge. Sinking, however, was continued, and a few days ago the ledge was struck again, and is now in the shaft not only large but rich.

Rough & Ready.—Macauley & Roberts, after a run of four days, cleaned up 11½ ounces of gold....Frank Torpey & Co. (on the McCharles ranch) have raised a shaft from the inner end of their tunnel and through the gravel. The tunnel is in 700 feet, and the Co. have been three years in running it. The flume is 20 by 20 inches....Landis, Black & Co. have commenced piping on their claims on Goshen Hill. They use Craig's globe nozzles, and have 4,800 feet of 11-inch iron pipe. They use 200 inches of water....McCall & Co., on Osceola ravine, are drifting in gravel which pays them $10 per day to the hand. ....The Sazerac Co., adjoining Webster & Co. on the west, cleaned up $120.50 after seven days' drifting by two men....Reynolds & Co. are sinking a shaft four hundred yards southwest of Webster & Co., and will put on machinery as soon as water is reached.

North Star.—*National*, March 31: We learn that this Co., at the French lead, are taking out excellent ore. In drifting in one of the levels and taking up the ledge, over $1,000 was taken out of about 400 pounds of ore.

Stopped.—*Gazette*, 31st: We learn that the Nevada Consolidated Co., at Burrington Hill, have been compelled to stop running for the present, in order to cut down the bed-rock. The lead pitches deeper into the hill than anticipated. They are bringing up a cut four or five feet deeper.

Resumed.—A. Downie commenced work to-day in the claims of Archibald Nevins, at Lost Hill.

Mulberry Ledge.—*Transcript*, April 1st: This is a new discovery, on Gold Flat. The ledge is close to and parallel with the Schoolboy. About five tons of rock have been taken out of the shaft, the ledge of which is eighteen inches thick, and the gold plainly visible all through the quartz. It is put down as $50 rock by competent judges. Preparations are being made to put the Schoolboy claims in working order, and a thorough test will be made by a crushing from this ledge, which is over three feet thick.

PLACER COUNTY.

Indian Mound Ledge.—*Herald*, April 2d: This mine, lately discovered, is in the edge of Ophir, on the south side of Auburn ravine, and belongs to Choat, Staples & Co. The claim extends 400 feet on the main ledge. The shaft is now down 20 feet. Some 60 tons of quartz milled at four crushings, $800; one of the crushings yielded $7. Two others, $15.50, and one $18 per ton. The ledge is from two to three feet thick, and the quartz easily taken out. The gold is free, no sulphurets having yet been struck. The owners have purchased the St. Lawrence quartz mill and water right, and the Hathaway mine connected with it. This claim has been traveled over nearly every day for 20 years, and at last an old settler struck his pick into it. At the rate the shaft has yielded there are really $60,000 in this 400 feet within 20 feet of the surface.

Important Sale.—The entire property belonging to the American River Water & Mining Co., consisting of dam, ditches, etc., commonly known as the North Fork ditch, has been sold to the Auburn & Bear River Water & Mining Co.

PLUMAS COUNTY.

Struck Gravel.—Quincy *National*, March 26th: The American Co., at Washington hill, have struck gravel in their tunnel which prospects well. This tunnel has been a number of years in progress.

STANISLAUS COUNTY.

Silver Mines.—Tuolumne City *News*, April 1st: From a friend we have learned of the discovery of rich silver mines in the Coast Range, not far from Orestimber, in this county by Mr. Newsnm. The discovery has created considerable excitement in the neighborhood.

SAN DIEGO COUNTY.

The special correspondent of the San Diego *Union*, March 31st, says the Washington looks better for permanency than at any previous time. The Lincoln is two feet wide at the depth of 25 feet, and as rich as at the surface. They have 20 tons out which will pay from $50 to $100 per ton. A tunnel 1,000 feet long would cut seven ledges, including the Washington. On the 22d, Chas. Hensley discovered, ten miles from Julian City, a two-foot ledge, well defined, bearing ore of great richness, every piece being thickly studded with gold. It is called the Stonewall Jackson. A fifty-foot shaft is being sunk upon it. Ten hours after the discovery there were 500 people on the ground; a meeting was held, and a district formed, called the Hensley.

The special correspondent of the *Alta* writes that several claims promise well, but that the owners are generally unwilling to make arrangements with capital to develop them, but demand a cash price which is absurdly high for property the extent and value of which is as yet so indefinite. Several San Francisco parties have thus been deterred from making investment.

The New Mines.—A Los Angeles telegram of April 3d says: Fuller reports from the San Diego mines show that quartz mining will be a success. Very rich paying quartz is being taken out of the Hayden and other ledges in Julian. A large amount of rock—two to three hundred tons—has taken out, that will yield an average of $75 to $125 to the ton.

SHASTA COUNTY.

Highland.—*Courier*, April 2d: We are informed that a 13-hour run on the Highland mill, French Gulch, yielded 50 ounces of amalgam, and another of 10 hours 40 ounces.

Janesville.—Criss & Reese run eight days and cleaned up $246; Murray, 11 days, and cleaned up $210.50.

SIERRA COUNTY.

Items.—*Messenger*, April 2d: It is reported that rich ore has been struck in the Hog Cañon mine, owned by P. A. Lamping....The Oak Flat quartz mine has been leased and the mill started....A large quantity of good-looking rock has been taken from Ned Leonard's ledge, and milling will be commenced before long....We learn that the Kanaka mill is still running on excellent rock, of which there seems a goodly supply.

SISKIYOU COUNTY.

Quartz.—Yreka *Union*, April 1st: Uncle Johnny Camphell discovered a vein of quartz a mile southeast of Mugginsville, last week. The rock is well sprinkled with free gold.

Humbug.—Jones, Barton & Co. started up their new mill on Monday last, and have 80 tons of rock ready to crush, which will run as high as $25 to the ton.

Ætna.—Judge McConaughy is superintending the clean-up. From all that is known, the company has made a fine run.

Hard at Work.—Sheppard set his mill at work at Oro Fino last week, and the indications are good.

TRINITY COUNTY.

The Champion Miners.—*Journal*, April 3d: Two boys, aged seven and eleven years, sons of Mr. Gilzean, of Cañon City, have struck a very rich claim. The little fellows have their claim rigged in genuine mining style, work industriously, and take out from eight to ten dollars a day.

North Fork.—Wm. Ritterbush found a very rich deposit in the hill opposite the town two or three weeks ago, but kept it quiet. We are informed that astonishing prospects are obtained. R. J. Holmes has been opening a new claim, and this week struck it rich. Three days' drifting by two men washed up seven ounces. Our informant says he saw three dollars got upon a shovel.

Lower Trinity.—Thompson, Bontecou & Co. are digging a ditch from Hawkins' gulch to Davis' point, that will afford water for several companies. This section is known to be good....Three days' washing by Thompson & White, at Horseshoe Bend, with what water they could catch during the rain, paid $100....Thomas Price has struck a good claim in the bar at Alex. Tinley's place.

Arizona.

Big Bug.—Prescott *Miner*, March 19th: The news from this district is first rate. A clean-up was made, one day last week, and a bar of gold worth $1,800 realized. This was the result of ten days' work with ten stamps.

Walker District.—Jackson & Co. will start the Eureka ten-stamp mill, to-day. The first rock crushed, after testing the machinery, will be from the Box Elder lode. D. J. Marr and others started for the district, Wednesday, with provisions and tools, to work the Accidental, one of the richest gold lodes in the county.

Weaver District.—An old pioneer is running an arastra, and Mexicans are at work in the placers. A very rich gold-bearing quartz lode was recently found between Peoples' Valley and Date creek. The people are said to be in a high state of excitement. Charley Gennng, Pete Smith, Fred Henry and others have taken up ranches and water-privileges in the valley. They have rich mining claims in Walnut Grove district, and it was their intention to build water-wheels and arastras.

Walnut Grove.—S. C. Rogers reports that Allen Cullumber bad struck good pay dirt in a large bar above his house.

Wickenburg.—At latest dates, the Vulture Co's 40-stamp mill was crushing. The company talk of erecting small works to operate upon the sulphurets. Work was being pushed on the tunnel of the White Picacho mine.

Yuma County.—J. S. Spann & Co. were adding more stamps to their mill, 20 miles above Fort Yuma. Other parties were building arastras on the California side of the river, near the Picacho, and Valentine & Co. were operating with their dry-washer.

Los Angeles, telegram, April 3d: The Apache Pass mine in Arizona, sold to a San Francisco Co., has been taken possession of by Mr. Arnold, now at Tucson. Work will be soon commenced.

Colorado.

Items.—Central City *Herald*, March 16th: George Barrett's mill is running on ore from the Roderic Dhu lode....Native silver is found in all parts of the Coaley mine. The vein never looked so well....E. S. Perrin is working on No. 4, East Pewabic lode, Russell gulch. He has three feet of good iron in the end of his drift...."Kill-Do" is the name of a new lode discovered by Geo. Cowie, Jr. A prospect of half a pound of the quartz yielded one-half pennyweight of gold....We hear of a number of new mining enterprises. We believe that the coming summer is going to be lively. Gilpin county will produce a third more gold this year than last....Ira Austin, on the Grace lode, Gold Dirt district, is taking out good ore. He proposes to start up the Hollister mill in May.... Charles Barton and Richard Irwin have been working the Orion lode, on Fall river. Their shaft is now 40 feet deep. The crevice is six feet wide. Select specimens assay $400.

Gambel Gulch.—J. W. Holstein has completed a ditch for conveying water from South Boulder to Gambel gulch. This will supply water for one thousand feet of the gulch, and it is proposed to begin with a hydraulic soon.

The U. P. R. Lode.—At present 20 men are engaged, producing 90 tons per week, supplying a 40-stamp mill and averaging $16 per ton. Selected quality has run as high as $40 to $45; second, $12 per ton. These were milling ores, leaving still smelting ore, for which $100 was paid at the smelting works.

Gilson Gulch.—Same of 30th: A silver brick of 770 ounces, from the Franklin works, arrived yesterday. Gilson Gulch presents more activity. Yesterday the road was full of teams loaded with quartz.

Marshall Tunnel.—*Register*, 30th: Gen. Marshall reports that his tunnel has reached a depth of over 600 feet from the mouth, and the heading is now very near the Equator lode. Carpenter, Simmous & Co. have struck, in one of the upper levels, a large vein of very rich ore.

North Clear Creek.—Walker & Rollins were able to show our reporter a good sized thing full of gold, to say nothing of what has been converted into greenbacks for a couple of months past. The pay streak extends 90 feet in width across the bed-rock, which is 20 feet below the bed of the creek.

Idaho.

Review.—*Avalanche*, March 26th: The Empire shaft is down 75 feet and shows a ledge 2½ in width. The Davis Bros. are pushing ahead the tunnel on the Peck & Porter, and have 10 or 12 feet yet to complete the contract. Lately they found the ledge broke up, but have now come upon a well defined and rich gold bearing vein, a foot in width and getting wider. There is 80 or 90 tons of fine ore on dump. The Davis Bros. are also working the Corduroy by contract. The shaft is 160 feet deep. Hoisting has been done by hand, but a whim is being erected. The second level has been run north 155 feet. Sixty feet further will take it to the Peck & Porter. The Baxter is yielding splendid ore, which will be milled as soon as spring opens. The Golden Chariot continues to yield its quota. On Wednesday we saw severals tons hoisted which displayed richer ore than ever. Work is going on as usual on the Ida Elmore.

Poorman.—There is said to be a thousand tons in sight of a vein of ruby silver, as rich as ever the Poorman was in its most prosperous days. By next week we shall know more about it.

Good Yield.—Four hundred tons of Golden Chariot ore crushed during February, yielded $35,050—nearly $90 per ton.

Montana.

The How Lode.—Virginia *Times*, March 21: The tunnel has reached it at last, and the crevice is 5 feet in width.

Boulder Valley.—Cor. of same, 23d: Miners and laborers are already in demand. The Boulder Ditch Co. will engage a strong force on Peru and Spring Bar. Stuart and Anderson will need reinforcement on the "Old Bar," and various other companies intend to employ bands enough to make the most of the abundant supply of water expected.

Green Campbell.—We learn that good ore is struck in the upper tunnel. In the lower tunnel the rock has become softer, and it is thought that the breast is not more than 15 feet from the lode. The Everett mill will soon be pounding away.

Postlethwaite Mill.—This is to be removed to the Keating lode. This lode is developed for a depth of 125 feet, showing a crevice almost 5 feet. The average yield, by working process, is $35 per ton.

Philipsburg.—Cor. of *New Northwest*, March 18th: The cold snap has retarded operations, causing delay in starting up the mill. It will require two or three days' time to put everything in working order. Miners report a rich pocket in the Comanche. Cole Saunders announces arrangements for a smelter and active operations within sixty days.

Nevada.

COPE DISTRICT.

Mountain City Mine.—Elko *Independent*, April 2d: Lately, at a depth of 70 feet, richer ore than ever has been struck. The vein stands nearly perpendicular and averages three feet in width, with well defined walls. B. F. Page, of San Francisco, made an investment in it for himself and friends, and has taken hold in good earnest in its development. The work of stoping out ore has been commenced.

Cope Bullion.—The last stage from Mountain City brought down bullion; $3,000 from the Argenta.

Bull Run.—The Porter company organization is perfected. We are informed that the tests of ore are flattering; the smallest yield (actual working test,) exceeding $225 per ton. As the ledge has been opened in three different places to a depth of 25 feet, showing a mine three feet wide, all mineral. The owners have reason to expect good results.

HUMBOLDT.

Gold Run.—*Register*, April 2d: Chambers and Martin are still experimenting upon base ores, Webb's mill.

Ed. Lovejoy is taking out ore from his extension of the Golconda, which is the best yet developed in the district.

Hurst, Burns & Agnew are developing their claim on the Shepardson with energy.

The Cumberland mine never looked so well. Work has been suspended while there is 45 feet of stope on the vein which averages nearly two feet of excellent ore, worth $150 per ton.

Mix & Co., of San Francisco, talk of erecting a furnace here, which is just the thing we need, as ninety-nine out of every hundred tons of the ores of this district are refractory and contain a large percentage of galena, but will yield good returns by smelting process.

Galena. — Cor. of same: The Buena Vista mine, on the mountain back of town, the father of the district, is progressing slowly. Upwards of $12,000 have been expended. The Butte mine, one mile below town, is well situated, easily worked, and ore from $300 to $500 per ton. The Avalanche mine is in a dormant state at present. Its owners contemplate opening it up as soon as work is commenced on the smelting works.

WASHOE.

Yellow Jacket.—Gold Hill *News*, April 2d: Daily yield, 300 tons, 150 of which are low grade from the lower levels. The ore body, of recent discovery, breasts out 30 feet in width, and has been raised upon one set of timbers. Assays from it run from $30 to $350 to the ton, and the best portion would mill over $50 under the stamps.

Imperial-Empire.—The bottom of the old Alpha incline was tapped by the raise from the 1,100-foot level, north drift, last Tuesday. The great body of water will all be drained out by to-morrow night. The cross-cut west from the south drift of the Imperial Empire has reached the ledge in the Holmes ground, but as the miners have been shut down since 6 o'clock evening before last, outsiders are not posted as to the developments.

Gould & Curry.—This mine is yielding nearly 100 tons of ore per day, and the ore gives an average assay of $55 per ton.

Hale & Norcross.—The shaft has not yet reached the west wall, but still continues in good looking ore. The mine is yielding 145 tons of ore per day, principally from the 6th level.

Chollar Potosi.—Daily yield, 150 tons; average assays, $45. General improvement throughout the mine, and a promising new body of ore developed at the south end of the Blue Wing section.

Belcher.—About 80 tons per day is the regular yield, all from the upper levels, most of which is reduced at the Rhode Island mill.

Overman.—Yielding 145 tons of fair grade ore per day. The ore body at the 226-foot level widens as developed southward. The 500-foot level is looking well.

Ophir.—Depth of water in the new shaft uncertain. The new shaft, in the Moscow ground, is nearly 200 feet deep, and the new steam hoisting works will shortly be ready.

Exchequer.—Work is to be commenced forthwith to open the mine and take out ore for milling.

Kentuck.—Daily yield 55 tons. Receipts for February, $29,300.82. The lower level drifts show little encouragement.

Crown Point.—The upper levels yield 70 tons of light-grade ore per day.

Virginia Consolidated.—Drift west 192 feet in from the 500-foot station of the new shaft to-day. Rock favorable, no water, and work progressing well.

Caledonia.—The shaft completed to the 200-foot level and a drift started west for the ledge, which is probably 30 or 40 feet distant, with plenty of good ore.

The miners in the Imperial-Empire shaft, who have not been allowed to come out since March 31st, were still in durance on April 4th.

WHITE PINE.

Items.—*Empire*, April 3d: **Eberhardt** working 30 men, and shipping ore to the mills at Shermantown. The ore yields from $100 to $200 per ton.... **Wabash** continues to yield a large quantity of good ore..... **Consolidated Chloride Flat.**—A large number of men busily employed in taking out ore..... **Original Hidden Treasure.** — A large force at work, and good ore taken out, a portion of which is shipped to the Big Treasure mill.... **Black Cloud** is owned in San Francisco by George Hearst and others. E. J. Ryan, Supt., last week put a force of men at work and is taking out from five to eight tons per day of fine ore. The ledge is eight feet wide. ....**Montrose** has now on the dump 100 tons of good milling ore which was taken out last spring. There is now a large body of high-grade ore in sight.... **Pogonip & Othello** have been recently sold to a Chicago company.... **Silver Wedge** has a shaft down 63 feet. The ledge is nine feet wide. Some 40 tons of ore now on the dump. The owners have "chopped" on the mills, and will either sell the ore at the dump or keep it.... **Montuk** shaft is down 60 feet. During the past week 30 tons of excellent milling ore have been taken out in sinking the shaft. The bottom of the excavation shows considerable horn silver.... **Tom Paine** is about to pass into the hands of a Chicago company.... **Mammoth** is being opened in good shape.... **Pocotillo Flat.**—Several mines in this locality are being worked with encouraging results. One shaft has attained a depth of nearly 200 feet, and gives good prospects. ....**Eleo** continues to yield a large amount of high-grade ore.... **Blackfoot** is showing a larger quantity of ore and of better quality.... **Buttercup** is being opened in good shape, and a large amount of rich chloride ores taken out.... **Idlewild** is now yielding good milling ore.... **Jennie A**, below Bullion Hill, continues to yield a large amount of first class smelting ores.

Most of the furnaces of the district are now in operation. The furnace of Hall, Bradley & Co. started up Wednesday, and on Saturday had 30,000 pounds of bullion. The product of the furnaces for the coming week will be not less than 200 tons of bullion.

Items.—*News*, 3d: The Alsop works fired up on the 1st.... The Shermantown Smelting Works are turning out bullion worth $300 per ton in silver, and contains forty-seven per cent. of copper.... Base bullion weighing 27,000 lbs. shipped on the 1st overland to New York from Alsop works. ....The Silver Park Co's 5-stamp mill has started up.... Col. Buel shipped 25 tons of metal from Eureka to Carlin a few days since. The camp at Eureka is destitute of cash, though rich in resources.... The Rappahannock ledge, in Cooper District, is from 15 to 20 feet wide, and rich.

Ely.—*Empire*, 1st: Whitney & Co. of Elko have shipped thirty-five tons of mill machinery, by mule teams, for Ely District. The machinery is for a twenty-stamp mill, and is for the Meadow Valley Milling and Mining Co. Bird's teams arrived yesterday with twenty-four tons of ore from the Pioche mine. The ore is estimated to be worth about $1,200 per ton. Bob Logan has a 25-foot ledge that works $71 to the ton.

Spring Valley.—George Ziki and Martin Boothby, in their North Star mine, are getting $500 milling ore, which needs hardly any assorting. The Page & Corwin mine is now down ninety feet, and the ore at that depth is exceedingly rich.

San Francisco Mining Stock Market.

After a long period of depressed prices and restricted sales in the mining share market, a good deal of activity has been manifested of late in this class of securities, accompanied by a sharp advance in several leading stocks and a considerable improvement in many others. This movement, which was inaugurated in the early part of March, grew out of a series of favorable developments in certain claims on the Comstock lode, occurring in the first instance in the Gould & Curry mine. The extent and progress of this improvement is indicated by the prices ruling for the stocks thus favorably affected during the past two months: thus, on the 10th day of February last, Gould & Curry stock was quoted on the market at $40 per share; Chollar-Potosi ruling at $18; Overman at $70, and Imperial at $27.

That this advance is mostly due to favorable developments made in the mines themselves, and not to mere extraneous causes, may be inferred from the fact that we have well authenticated evidence that such developments have been made, and from the further fact that the stocks of other companies in whose claims no marked improvement has occurred, have failed to participate in this upward movement—these latter being, in some cases, lower now than they were several months ago. That this appreciation of Washoe stocks will, by strengthening confidence in these properties generally, tend to the enhancement of mining values, admits of no doubt; nor is it reasonable to suppose that the present animation in the mining share market may not be due in part to speculative schemes and combinations. The presence of these agencies must always be counted upon, and the more animated the market the better their opportunities for effective action.

But, making all allowances for influences of this kind, it may safely be assumed that there is much in the condition and prospects of the mines themselves, more especially of the leading claims on the Comstock lode, to warrant this advance in the price of stocks, and even justify the belief that they will not soon recede to former low figures. The recent strike in the Gould and Curry mine would seem to point to extensive deposits of high grade ore, several other companies having recently developed valuable bodies of ore in their lower levels. This last set of facts is important, as bearing affirmatively on the question of the continuity of this great ore channel—a point that former explorations had begun to render problematic. With these revealments, the Comstock lode may be said to take a new lease re-establishing that trust which geological deductions had taught us to repose in its permanency, and awakening the hope that its productive energies will be restored to something like the days of its pristine vigor.

The most of the prominent companies located on this lode are now raising large quantities of ore, which, with present facilities for its transportation and reduction, should return a generous profit, relieving them from the necessity of imposing further assessments on the stockholders. That this will so result, is confidently expected, leading to a buoyant market, and the maintainance of steady prices. Under this improved feeling, it seems probable that new stocks of this kind may gain a foothold on the market, and the programme of the Stock Brokers be made to cover a wide range of properties equally as valuable as most of those now operated in by the Board.

The mining stock market exhibited considerable activity during the past week, but, in most instances, prices show a recession, and in the case of Gould and Curry, the leading stock for some time, the decline has been rapid and heavy. Stocks, other than those composing the Comstock list, are becoming a prominent feature of the market; sales during the past week having been large, and at improved figures. In our next issue, we expect to give our customary quarterly statement of the bullion yield, dividends, and assessments of the various claims on the Comstock lode.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures for the first three months in 1867, 1868, 1869 and 1870:

MONTH.	1867.	1868.	1869.	1870.
January.....	$2,664,322	$8,698,934	$7,964,734	$3,857,789
February....	3,303,520	9,716,596	6,818,644	3,139,433
March.......	4,034,289	11,471,830	6,954,145	6,662,996
Totals.....	$11,002,131	$29,887,360	$21,737,523	$13,660,218

Chollar-Potosi—has met with less inquiry, but has been well maintained during the past week. For the week closing April 1st, 1,217 tons of ore were extracted, showing an average assay value of $52 93 per ton. All the faces in the Blue Wing stope are equally as promising as they were at the commencement of March, and the April product is not likely to fall below that of the previous month. Forty-five feet have been added to the length of the west drift from the Chollar-Potosi shaft, making total length of drift 493 feet. At present, the material in the face of the drift is principally clay. The bullion receipts for March aggregate $113,189, against $91,545 in February. A dividend of $1 per share is payable from and after the 11th inst.

Gould & Curry—exhibited a very material fall the past week, and has withal been the leading stock in the Board. During the week ending April 4th, 580 tons of ore were mined, showing an average assay value of $72 40 per ton. In the El Dorado section, the ore improves as the body is raised on. They are now up forty-four feet, and the ore coming from the extreme top is better than any taken out of the stope. The other ore sections are without change. In cross-cut No. 2, at the seventh station, the quartz is about eleven feet wide, and the largest assay obtained from samples from this section is $18 40 per ton. The north cross-cut, No. 3, is now in forty feet, and has clay with quartz mixed through it. The bullion yield for March amounts to $50,213, against $33,389 in February.

Hale & Norcross — continues in fair request at a slight decline. During the week ending April 2d, 1,158½ tons of ore were extracted; previous week, 1,025½. They have on hand at dumps 6,141¼ tons, of which 2,485 tons is low grade. A letter of the 5th inst., says they are preparing the seventh station, and that the winze from the sixth station is now down 25 feet, the average assays from that locality showing over $200 per ton. They do not yet know the width of the ore vein, as the winze descends in it, and does not touch either the east or west wall. They cannot cross-cut in the winze, as it would increase the water, which is already very troublesome. A dividend of $6 per share will be paid on and after the 9th inst.

Savage—has been well maintained. The bullion product for March foots up $23,030; in February it amounted to $7,035.——**Kentuck** has been dull of sale. For the week ending April 1st, 305½ tons of ore were extracted, showing a 65 per cent. assay yield of $4,213 53, which is equal to $13 81 per ton.——**Crown Point** has been moderately dealt in at uniform rates. For the week closing with April 3d, 456 tons were mined, the 65 per cent. assay value being $7,663 79, or $16 80 per ton.

Belcher — sold to a greater extent than the previous week, and at somewhat better rates. Dates of the 5th give the information that the stopes above the 152 level continue to yield about 70 tons per day. In the 730 level, after passing through the clay, they got into vein matter, and the indications for ore are very promising as far as they have been able to prospect.——**Imperial** has been in good request at a fair figure. On the 5th inst., the Superintendent wrote — "I have made no headway with my south-east drift since last night; the water was coming in so fast I had to brace the face and put in a set of timbers. The water from the Alpha incline came in with a rush this evening, sweeping timbers and air boxes down the incline."

Overman — has been in moderate request at an advance. The bullion returns for the month of March aggregate $72,000; in February they were $57,613.——**Sierra Nevada** also commands better prices. Yield of bullion for March, $15,600; in February, $12,300. —— **Caledonia**, which is a south extension of the Overman, shows a bullion product of $7,276 22 for March. —— **Flowery** levied an assessment of $1 per share.

Amador (Cal.)—continues to be firmly held. A dividend of $10 per share is payable since the 7th inst. —— **Eureka** (Cal.) disbursed a dividend of $7 50 per share on the 7th inst.—*Commercial Herald.*

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

[Compiled weekly from advertisements in the Scientific Press and other San Francisco journals.]

New Incorporations.

The following have filed certificates of incorporation with the County Clerk, San Francisco:

Electro Magnetic Sewing Machine Co.—San Francisco. March 30. Capital stock, $1,000,000; 16,000 shares, $100 each. Trustees: George Stevens, Joseph Hendy and Wm. Barstow.

El Dorado Ditch and Water Co.—El Dorado county. March 30. Capital stock, $50,000; 500 shares, $100 each. Trustees: G. W. Ramage, M. M. Baldwin and H. H. Schafer.

Mahogany G. & S. M. Co.—Owyhee. March 28. Capital stock, $502,000; 6,020 shares, $100 each, Trustees: A. P. Minear, W. L. Greenwell, L. Bessarin, Geo. Hearst and O. H. Bogart.

Golden State Iron Works Co-operative.—San Francisco. April 6. Capital stock, $100,000; 200 shares. Trustees: Hugh F. Ross, Andrew Corigan and Charles H. Knox.

Saucelito Water Co.—Saucelito. April 6. Capital stock, $100,000; 2,000 shares, $50 each. Trustees: Jas. H. McNulty, Henry Marshall and Leonce Girard.

◆

A New Light.—We are seeking every day for better, and, at the same time, cheaper apparatus for lighting our houses. Messrs. P. J. Philips & Co., 650 Market street, have an apparatus for which they claim many advantages. It can be carried about and affixed anywhere, is very simple, and gives a bright flame. We could detect no escape of smoke or gas, the combustion being so perfect, and this is certainly a great advantage. It is easy to limit the amount of gas burned, and there is no danger of getting clogged, as it automatically cleans the passage whenever it is turned off.

◆

Newspaper Change.—The Grass Valley *National* and the Nevada *Gazette* have been purchased by an association of gentlemen, who have consolidated them under the name of *The National Gazette*,—to be published in Nevada City, and to be devoted to the Democratic party.

◆

Farmers desiring good, strong and substantial farm-wagons which will stand wear and tear, will do well to consider the advertisement of Messrs. Meeker, James & Co., before purchasing elsewhere.

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

California Wheat and Flour.

It is well known that owing to the peculiar dryness of the atmosphere of California during harvest time, the wheat of this State is so dry, that in passing from hence to a region of ordinarily humid atmosphere, it will absorb a large amount of moisture, thus gaining materially in weight. This gain oftentimes amounts to a very large percentage, and forms an important item in the profit of shippers or foreign buyers. The amount of this grain can scarcely be realized by one not actually conversant with the business. The dryness of California wheat is often so excessive as to unfit it for making first quality flour, when otherwise the grain is the very acme of perfection in that product.

Much of the wheat raised in the moist climate of England contains too much natural water to make good flour, and it is difficult to expel that excess of moisture except by kiln drying, which is too expensive. To remedy this defect, California wheat is largely sought for, there, to mix with the moist English wheat, by which means both are improved, and the proper medium of moisture is thus obtained.

The wheat in this State varies largely in its amount of moisture, according as the locality of its production is subject to moist sea breezes or to winds which have lost their moisture by the dessicating action of the cooler air of mountain summits, over which they may have passed. In the matter of flour, we have been assured by those who have a practical acquaintance with the subject, that "California Extra" absorbs fifteen and sometimes even twenty pounds more of water to the 100 pounds of flour than the same quantity of Eastern or English flour will take up! Bakers using that brand thus gain a large percentage in the weight of their loaves, when employing the same amount of flour. These facts are worthy of note, and add much in securing a preference abroad for California flour over that raised in most other countries.

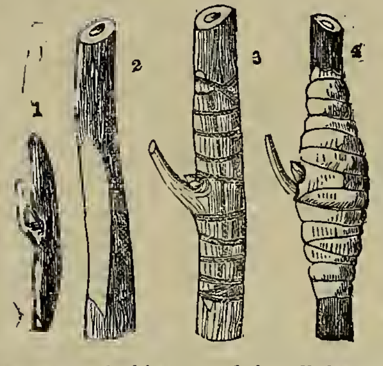
Coal Gas Not Injurious to Trees.

Dr. Poselger has shown by repeated experiments that the growth of trees and shrubs is not interfered with by any quantity of coal gas that may escape in the soil and find its way to their roots, and consequently that the illuminating gas escaping from mains does not injure the trees growing along the streets and promenades of cities, as many persons had previously supposed.

So says an Eastern exchange. We have ever been inclined to the opinion that the destruction of trees in the streets of cities has been due to the covering of the surface of the ground with hard packed cement or pavements impervious to moisture and air, rather than to the escape of gas from the pipes which are usually placed in close contiguity to the roots of such trees. The reasons for such belief are founded on the fact that coal tar and natural asphaltum have been found especially beneficial to vegetation when applied, in limited quantities, on or near the surface of the soil. As the fixed or free carbon in such substances is insoluble and undecomposable by the action of air, moisture or other substances in the soil, it follows that the benefit which accrues to the plant must be derived from the volatile portions of such carbonaceous matters—which are identical with the illuminating gas that has been charged with producing so much mischief. These volatile matters, which consist chiefly of carburetted hydrogen, are no doubt assimilated in the same manner as the plant derives its carbon from the carbonic acid of the atmosphere and soil.

Budding the Grape Vine.

Grafting, budding and pruning are arts that should be fully understood by whoever practices them. A pruner must understand why he prunes—why he cuts this limb in preference to that; the grafter and budder should also understand his art, which must be acquired by earnest study and patient practice. The importance of this fact should be especially borne in mind at this time, when it is admitted on all hands that a large proportion of the vineyards in this State are of little value by reason of the error committed at the outset, in not selecting the proper varieties; it is intimated by some that fully nine-tenths of the varieties now cultivated ought to be discarded and better ones substituted. The labor and expense involved in such a change is immense, and our vineyard-growers are looking around for all the information attainable, which may be of aid to them in this direction.



Either budding or grafting the grape vine is a much more difficult and uncertain task than performing the same operations upon most other fruit-bearing woods. Grafting is generally adopted for the grape, and in our issue of the 26th ult. we described a most excellent process devised and practiced by Mr. Briggs, of Oakland. To-day we describe and illustrate a process of *budding*, about which the English horticultural journals have had much to say of late. These journals have been replete with accounts of the remarkable success that has attended this mode of propagating, which has only lately been introduced and described. A recent number of the London *Field* gives an account, of which we give an abstract and copy its engravings. The operation may be performed upon the vine, or upon the laterals; the best time is when the wood of the stock is about half ripe. A bud is cut as shown in fig. 1; the stock, fig. 2, has a corresponding cut made to receive the bud; there is a nick at the lower end of the cut which receives the lower end of the piece containing the bud, and holds it in position. The surfaces of the bud and stock are made to fit as evenly as possible, and are bound together by bast matting, as shown in fig. 3. Afterwards a bandage of cotton-wool, extending an inch below and an inch above the wound, is placed on in such a way as to allow the bud and leaf stalk to be exposed, and is bound on firmly. The cotton is to be kept moist for several weeks. The bud does not start until the following spring, when it produces fruit as readily as the natural buds of the vine.

The practice has thus far, we believe, been confined to grapes under glass, and probably some modifications would be necessary for it to be successful with out-door grapes in the dry atmosphere of California.

It will be seen that the process here described is more of a grafting than a budding process; as a large portion of *wood* is removed with the bud. It is really an old method of grafting, in which a scion with a single bud is employed.

We give it simply as a method that is now attracting much attention in Europe; but not as one which we would pronounce preferable to the grafting process employed by Mr. Briggs.

Gypsum as a Fertilizer.

The rapid deterioration of the fertility of the soil in California, especially of our wheat lands, involving the consequent diminution of crops, has been for several years a source of much concern to our more intelligent agriculturists. It has been found that notwithstanding the richness of the virgin soil, a few years of constant culture greatly diminishes its productive powers; and the absence of the ordinary sources of fertilizing agents on this coast has heretofore led our farmers into a sort of compulsory neglect of any material effort to supply the annual waste of our lands from constant cropping. Whenever the matter has been brought up for consideration, it has been met with the almost unanswerable argument of a total lack of fertilizers, within reasonable reach and cost.

Nature, however, has not been unmindful of our needs, albeit we may have been somewhat slow in finding out her hidden resources. Some two or three years ago an inexhaustible bed of *gypsum* was discovered, within convenient shipping distance of this port, which was soon opened, and large quantities have since been brought hither for employment in the arts and for use as a fertilizing agent.

The experience of the Eastern States and of Europe has long since proven this mineral to be one of the most important fertilizing agents which has ever been introduced to the notice of the farmer, not even excepting guano, itself. It not only furnishes a direct food to certain plants, but it also acts as an economizer of other fertilizers, and is an actual *collector* of plant food from the atmosphere.

When we mix pulverized gypsum with ordinary fertilizers, such as stable manure or any other decomposing substances, it immediately collects and holds the constantly escaping ammoniacal gases, and transforms them into just the condition to render them most easily taken up and assimilated by the plant. When mixed with the soil it is always at work, day and night—not only feeding the little plant rootlets with which it may come in contact; but while it dispenses this food, it is at the same time busy in collecting additional supplies from the decomposing substances in the surrounding soil, and even from the atmosphere itself—the larger portion of which, is, in the use of ordinary fertilizers, entirely lost.

So important is this mineral fertilizer considered at the East, that in addition to the immense quantities which are supplied from our own quarries, nearly 200,000 tons are annually imported from abroad, to supply those localities which are situated at too great a distance of land travel to be economically supplied by the home product; and this demand is rapidly increasing.

The finding of an ample supply of this fertilizer, so near our own doors, may be considered one of the most important discoveries which has been made on this coast since the first finding of gold at Sutter's mill. It is of more value than many times its extent of rich gold mines; for it will be to the great agricultural industry of California what the quicksilver mines of New Almaden have been to our gold and silver mines.

We have introduced these remarks more particularly at this time, in order to call the attention of our readers to the fact that Mr. C. J. Jansen, of this city, has become the pioneer in the introduction of this fertilizer on the Pacific coast; and also as an introduction to a series of articles which we have for some time proposed to write upon the subject. What gypsum is, how it acts, and how and to what crops it should be applied, will furnish a theme for several articles in the early future, which we shall endeavor to make useful and instructive to our readers.

Cool Soil for Fruit Trees.

One of the greatest drawbacks to California-grown apples is their inferiority in keeping quality. Any given variety of apples produced on California soil is inferior, in that respect, to the same variety grown in New England. This inferiority is not due altogether to the difference in the keeping qualities of the two climates, after the apples are removed from the trees; for the proposition holds good when New England fruit is transported to a milder climate, as in the Southern States or in England.

The same difficulty is encountered by Atlantic fruit-growers, when we go south of New York. The best region for apples, pears, cherries and currants, is found in a belt of, say 150 miles in width, starting, centrally, from Boston, and sweeping thence across the country through central New York, northern Ohio, and thus on to the Mississippi. Fruit-growers in the latitude of Philadelphia, which is still north of the isothermal line of central California, recognize not only this fact, but the further difficulty of diseased trees and decreased yield, and have long been seeking, by modified culture or change of varieties, to remedy the evil.

Mr. Thomas Meehan, of Philadelphia, a prominent gardener and fruit cultivator, attributes the difficulty to the excessive warmth of the soil, in contact with the roots, in southern latitudes, rather than to the influence of the atmosphere upon the foliage or fruit, and recommends, as a means of securing a lower temperature in the soil, the seeding of orchard land with grass, or otherwise mulching the ground, to keep it cool and moist. Mr. M. found, on observation, that the soil was 20° cooler under the grass than under a clear, loose surface; the soil also being moister. The editor of the Cincinnati *Gazette*, in commenting upon this matter, says:

> We have a small orchard of about forty trees, that has been for years remarkably profitable and productive. It is situated on the gentle slope of a hill, and underdrained, and has been kept in grass for the last fifteen years. As often as once in two or three years the ground is hooked and spaded over, in the autumn or early winter, to the depth of four or five inches, around the trunks of the trees, and extending out as far as the limbs extend. Also, on the same space a good coat of manure is spread, about every other fall, sometimes slightly forking this into the soil in the spring following. The amount of fruit we have gathered from this one acre of orchard, during the past fifteen years, is fully equal to any five acres product of our neighbors' orchards.
>
> It should be borne in mind that even when the ground is forked or spaded over, owing to the manure that is frequently being added, the ground becomes quickly coated with grass, so that the surface under the trees is in grass nearly all the time, as well as that portion of the ground not directly under the tree tops.

Mr. Barry, the eminent Rochester horticulturist, while acknowledging the importance of coolness and moisture, advises the use of hay or straw as a mulch. He would not use clover as a live mulching crop, because it grows too strong and exhausts the moisture.

This matter is something certainly worthy of the thoughtful consideration of California fruit-growers, and we should be pleased to have the personal experience or opinions of some of our orchardists.

Method for Increasing the Flow of Wells.—A Lyonnese engineer, M. Donnet, proposes to increase the flow of wells by closing the mouth closely with a sheet-iron bell, through the top of which passes a tube attached to a pump. When the pump is worked, if more water is withdrawn than naturally flows into the well, the water level is lowered, there is diminution of pressure on the surface, and an increased supply will result.

Prices are tumbling at the East.

Poisonous Plants in California.

Mrs. Proctor, of Centerville, Alameda Co., a great lover of flowers, and one who has a large number of choice varieties, among which are embraced many peculiar to California, has requested our Alameda correspondent to obtain the names of four which were blooming in her garden at the time of his visit. The plants were submitted to Mr. H. G. Bloomer, one of our best botanists, to whom we are indebted for the following:

The beautiful liliaceous plant, with dark, bell-like flowers, is the *Fritillaria mutica*, or Guinea Hen Lilly—the "rice root" of the California miners.

The little blue butter-cup-shaped flower belongs to the order *Hydrophyllaceæ*, and is a *Nephomilla insignis*.

A small, pure white flower, called the "Morning Bride," is a *Gillia*, and belongs to the order *Polimoniaceæ*, or Phloxworts.

These three are all harmless and truly worthy of lavish culture and prominent place in our gardens, being already cultivated in the East.

A Poisonous Flower.

The fourth of those submitted—a bulbous plant, with a spike of white, yellow-tinged, star-shaped flowers—*is poisonous*, and belongs to the order *Melanthaceæ*. It is named *Anticlea Fremontii*. About two years ago, a child below San José was poisoned, and died from the effects of eating of some of the flowers. Concerning this order of plants, we quote from Dr. Lindley's "Vegetable Kingdom:"

"Few orders of plants are more universally poisonous than this, whose qualities are conspicuously indicated by *Colchicum* and *Versatrum albane*. The corn and seeds of the former are well known to be acrid, cathartic and diuretic; the latter is a nauseous, dangerous emetic. These qualities are due to a peculiar alkaline principle called *veratrea*, which acts with singular energy on the membrane of the nose, exciting violent sneezing, though taken in a very minute quantity. When received internally, in very small doses, it produces excessive irritation of the mucous coat of the stomach and intestines. A few grains are found fatal to the lower animals."

The first named is, however, an invaluable medium in rheumatism, and the American *Veratrum virides* is also an excellent remedy in pneumonia.

Any further advice to the lady above referred to, or to others, to destroy and avoid this plant, would be superfluous. If cultivated at all, it should be properly indicated as a poisonous and dangerous flower, if grown where children can have access to it, and only as a means of informing others, by ocular demonstration, of the true character and precise appearance of the plant.

Dangerous to Animals.

This plant is found in the meadows that are mown for hay in most of our elevated mountain valleys and ravines. It is a common thing for animals eating hay in which this plant has been gathered to become seriously affected thereby. In some cases death has ensued. It should be carefully sought out and thoroughly eradicated from meadow, pasture and garden. Many of these plants, when they do not injure the cows, render their milk poisonous, and sometimes fatal, to children.

There are quite a number of poisonous plants, indigenous to this State, in addition to the one above described, which we propose to illustrate and describe in the Scientific Press, at an early date, for the especial benefit of farmers, stock-growers and others.

The Colorado Colony, of which Horace Greeley is President, has located on the delta formed by the Cache La Poudre and the Platte Rivers, on the line of the Denver Pacific Railroad, midway between Denver and Cheyenne.

Wool Clip.—On Tejon Ranch, one of the largest grazing ranches in southern California, the wool clip is given as 400 bales from 8,000 to 10,000 sheep.

Lithograph Stone.—The only bed of this stone in the country, as far as known, exists in Van Buren county, Iowa.

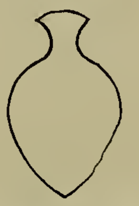
New Method of Packing Fruit for Transportation.

Mrs. Volney E. Howard, of Mission San Gabriel, sends us the following note with regard to a mode of packing fruit for distant transportation, which we would commend to the attention of our fruit growers:

I have a plan, which I know to be good, for packing fruit, so that it can be transported to the Atlantic side of the continent without injury. It is not an invention of my own, as it has been long used in Europe for the packing of grapes. I have eaten grapes in Washington City thus packed which had crossed the Atlantic and stood three months in the dealer's store, and which at the expiration of that time were perfectly fresh and nice. I advised some of my neighbors here to pack grapes after this manner for transportation to the Atlantic States; but as they are not sufficiently energetic to do so, with your permission I will make the process known through the columns of the Scientific Press.

Perhaps for this and other information I may from time to time send you you may be willing to send me your valuable paper. I should like any back numbers you could send me, and I will also take great pleasure in procuring subscribers.

The plan is as follows: Place the grapes in jars of this shape, which you often see lying about the streets of San Francisco. I do not know what is brought in them, or where they come from. The reason for the peculiar form of the neck is, that a wooden stopper must be put in which *must not fit exactly*, but which this shape of the neck will prevent from going into the jar. Into this vessel the grapes, after being *sweated*—dried—are packed with sawdust. The space above the stopper should be filled with slacked lime or plaster, wet, which, as it dries, absorbs the air out of the jar. Probably it would be well to place a tight cover over the plaster, so as to compel all the drying air to come from below; but the idea once given will, no doubt, be improved upon. Kegs could be used with a similar opening; but I presume jars could be made as cheap and better than anything.



Where and How to Apply Manures in California.

The above question, which cannot be decided by Eastern practice, was discussed at the last meeting of the Santa Cruz Farmers' Club. We collate from the *Times* and *Sentinel:* Mr. Morgan stated that he had applied manure in this country in various ways; but he preferred hauling it out early in the fall and leaving it in piles of four or five bushels, within a short distance of each other, trusting to the seepage from the piles to enrich and fertilize the entire tract. His experience, running through several years, had demonstrated conclusively to him the superiority of his plan.

Mr. Daubenhiss preferred scattering it over the surface just before the rains.

Mr. Humphreys was in favor of manuring early in the fall so as to get a green crop and then plow it under, and thus enrich the soil.

Mr. Doane agreed with Mr. Daubenbiss; he never hauled his manure out until two or three days before plowing.

Mr. Hackett thought no arbitrary rule could be depended upon. Location of land, as to whether level or rolling, ought to guide the farmer.

Mr. Humphrey said that the great want was the need of a green crop to turn under. And asked whether it would not be better to apply the manure early in the fall, so as to have green stuff to plow under early in the spring. He thought if the farmers would sow corn, and then plow the stalks under, it would be beneficial. In the States, buckwheat was sown in the spring, and plowed under in August. In the fall the land was re-plowed, and sowed to grain, and the result was a splendid crop.

Mr. Leonard desired to know whether putting lime on coarse manure would decompose the straw. Mr. Mattison, in reply, said it would destroy the manure.

Mr. Russell was in favor of making manure by erecting artificial vats, covering the bottom with three or four inches of lime and then filling them with alternate layers of straw and drippings, and then spread the compost on the grain as soon as it is three or four inches high. This, he said, is the European plan, and the one by which the air, which is the real decomposing agent, sets free and puts in operation all the fertilizing gases and properties of the manure. Lime, which is absolutely necessary for the production of good crops of grain, must be applied as the soil is exhausted.

Mr. Woods thought top-dressing would not be beneficial in this State, on account of over-dry climate. Dr. Anderson said that manure, to afford the most nutriment to plants, should be in the form of a solution.

Mr. Humphreys contended strenuously for the use only of thoroughly rotted manure, and then it should be spread from a wagon, so as to be evenly distributed. Mr. Mattison was in favor of hauling manure when it was dry, as it then contained only 25 per cent. of water; after the rains it contained fully 75 per cent. of water. He always spread it from the wagon.

The next question for discussion will be, "Can Flax be Profitably Grown in California?"

Irrigation--Means and Ends.

The above heading forms the topic of Mr. Greeley's twelfth talk to his readers. The subject is an important one, especially in this State. To rid the soil and keep it free of superfluous, and especially of stagnant water, and at the same time to secure to growing plants at all times a sufficiency of moisture, is a matter which requires much thought, and is at the same time one which urgently demands a practical solution from a great majority of the farmers of California. In discussing this question, Mr. Greeley refers his readers to the admirable and effective plan of irrigation adopted on the great plains of Lombardy, in Northern Italy, which he once visited, and of which he speaks as follows: "I saw there a region perhaps thirty miles wide by one hundred and fifty along the east bank of the Po, rising very gently thence to the foot of the Austrian Alps, which Providence seems to have specially adapted to be improved by irrigation. The torrents of melted snow which in spring leap and foam adown the southern face of the Alps, bringing with them the finer particles of soil, are suddenly arrested, and form lakes Garda, Maggiore, Como, etc., just as they emerge upon the plain. These lakes, rising slowly, often overflow their banks, with those of the small rivers that bear their waters westward to the Po; and this overflow was a natural source of abiding fertility. To dam these outlets, and thus control their currents, was a very simple and obvious device of long ago, and was probably begun by a very few individuals, whose success excited emulation, until the present extensive and costly system of irrigating dams and canals was gradually developed.

When I traversed Lombardy in July, 1851, the beds of streams, naturally large, were utterly dry; the water which would naturally have flowed therein being wholly transferred to irrigating canals, often two or three miles distant. The reservoirs thus created were filled in spring, when the streams were fullest and their water richest, and gradually drawn upon throughout the later growing season to cover the carefully leveled and graded fields on either side to the depth of an inch or two at a time. If any failed to be soon absorbed by the soil, it was drawn off as here superfluous, and added to the current employed to moisten and fertilize the field next below it; and so field after field was refreshed and enriched, to the husbandman's satisfaction and profit. It may be that the rich glades of English Lancashire bear heavier average crops; but those of Lombardy are rarely excelled on the globe.

Why should not our Atlantic slope have its Lombardy? *Utah, Nevada and California exhibit crude suggestions of such a system;* but why should the irrigation of the New World be confined to regions where it is indispensable, when that of the Old is not? I know no good reason whatever for leaving an American field unirrigated where water to flow it at will can be had at a moderate cost.

Mr. Greeley next proceeds to give some of his own experience in irrigation on his farm in Westchester. His early experiments, conducted by the aid of hired engineers, were quite unsatisfactory and costly; but he finally succeeded on a plan devised and engineered by himself, in so effectually irrigating a small tract of hill-side meadow that for the last ten years it has doubled its annual crop of hay, at comparatively trifling extra cost. And more than that he adds:

My hill-side, while it was well grassed in spring, always gave out directly after the first dry, hot week; so that when I most needed feed, it afforded none; its herbage being parched up and dead, and thus remaining till refreshed by generous rains. I judge, therefore, that my irrigation has *more* than doubled the product of those two acres, and that these are likely to lose nothing in yield or value so long as that petty irrigating ditch shall be maintained.

Dry Soil for Wine.—The grapes from which the famous Johannisburger wine (the finest and highest-priced wine in the world) is made, are said to be grown on hillsides, where the soil, especially at and about the time of ripening, is like a solid cake of burnt clay! Wine-growers in this State who do not already recognize the fact, have yet to learn that, in producing good wine, the roots of the vine cannot be kept too dry, at least from surface moisture. The roots should go down deep into the soil. A rocky bottom, in a volcanic or metamorphic region, is best—one full of seams which the roots can penetrate, so as to derive their moisture, charged with mineral salts, instead of depending upon surface moisture, which has not yet taken up from the earth the salts which appear to be so essential to the production of a perfect wine grape. The wine should never be allowed to receive artificial irrigation after it has come into bearing, and during its early growth, even, only sparingly.

Cheese.—The American Cheese Factory, near Alansford, Victoria, Australia, has commenced operations, and is the first of the kind opened in the Colonies. The *Australian*, from which we gather these particulars, says that the present apparatus has a daily capacity to convert 380 gallons of milk into cheese, on the factory plan. Cheese from the milk of 500 cows can be made by three hands alone; whereas, on the ordinary system, it would require four hands to make cheese from 100 cows. The owners take the milk to the factory, and receive a minimum of four pence—equal to eight cents—in summer, and four and a half pence—equal to nine cents—per gallon in winter, and have a guarantee that the price of milk per gallon shall never fall below two-thirds the price of cheese per pound. The price of cheese in Melbourne ranges from twelve to eighteen cents per pound.

Notices to Correspondents.

J. W. R., Bear Valley, Mariposa county, sends us a new plan for constructing railroads. He proposes a triangular rail with cogged sides laid along the center of the track on string-pieces mortised into the ties laid, say ten feet apart. The locomotive has one driving wheel and each car a guide wheel, cogged to fit this rail. On the ties on each side of the rail are fixed cast iron chairs containing rollers about eight inches in diameter, with outside flanges three inches high for steadying the cars, and on these rollers run the floor-timbers of the rolling stock, which are shod with iron. Our correspondent thinks that by his plan he obviates all danger of running off the track and of collisions (as the cogged arrangement would enable the train to be very quickly stopped), that much lighter cars can be used, and that the cost of rolling stock would not be more than one-half of what is usual now; also that steeper grades are possible. The matter of cogged wheels and rails for common roads is a very old and long since exploded idea. As to the rollers, one would be obliged to have a very nice road-bed to render them possible; and we would not like to guarantee a train's running a few rods without something being badly damaged. However, in accordance with our correspondent's wish, we publish this for the benefit of those whom it may concern.

Properly Appreciated.—A lady who has casually received a copy of the Scientific Press, writes the following appreciative note, which we take the liberty to transfer to our columns: "I received the number of February 12th of your extremely valuable paper. I had intended to take an agricultural paper, but I see that yours, in addition to much other valuable matter, gives such agricultural information as is truly useful on this coast; while papers from other States cannot guide agriculturists here. And as I also take an interest in all new scientific discoveries, I shall take your paper, as soon as I can anyway spare the money to send for it. I prefer it also for family reading to the pictorials which generally find their way into our families. I shall show the number I have received to my friends and endeavor to spread your circulation in this county, for every farmer ought to take it, if able."

What's the Matter, and the Remedy.

In our last issue we made some remarks upon the great value which our mountain lands possess for agricultural purposes, intimating that we should to-day explain the cause of their neglect, and the reasons why the agricultural lands of California, as a whole, are not more generally sought after by our own people, or by emigrants, for immediate occupation and improvement.

The great difficulty, at the threshold, grows out of the restlessness and discontent of our people with the regular gains of legitimate business. The present is emphatically an era of speculation. Professional men, merchants, bankers, miners, mechanics and laboring men of every class in our midst, are all alike drawn into this vortex of wild speculation. All are intent upon making a sudden fortune by some speculative movement.

Those who have nothing, are seeking to make a "raise" by their wits; and those who have what in other countries would be considered a moderate competency, are here in a hurry to become rich, to the end that *they* may also connect themselves with "rings" and "combinations," to more effectually carry out their speculative operations. Nearly all have become so thoroughly imbued with the spirit of speculation, that the sure and honest gains of legitimate business are almost entirely ignored; and as farming, above all other occupations, presents the least opportunity for such scheming, our people congregate in the cities and towns, where they can more readily watch the turn of events.

There, in the absence of anything more exciting, the spirit of speculation finds vent in city lot investments. So universal and speculative has this become in San Francisco, that we have now about twenty millions of surplus money—mostly the hard-earnings of mechanics and laboring people—thus employed in a business but little, if any, superior or more productive of values than the probervial one of "swapping jackets." In fact, a most pernicious result has already grown out of it, in the establishment of fictitious values upon real estate in this city, thereby increasing the cost of rents, living, and all kinds of merchandising, the injurious effects of which are felt all over the State.

Again, several millions of dollars are constantly employed in mining stock-gambling—in making "corners" in which to trap the unwary; in devising all manner of "tricks" in mine management, such as covering up rich ore, crushing worthless stuff, etc., to successfully carry on the "freezing-out" process, or more readily "bull" or "bear" the stock according to the programme of iniquity which may have been agreed upon by the "ring."

Thus it is that the surplus earnings of our people are diverted into all manner of mischievous and generally profitless speculations instead of being employed in the creation of actual values. Thus it is that we have no money for legitimate investment, in developing the real wealth of the State—for establishing a diversified agriculture, and building up manufacturing interests to give certain employment to the poorer classes, more extensive occupation to our mechanics, enlarged business to our merchants, and to provide a ready market for our farm produce. Hence it is that so large a proportion of our rich mountain valleys and our broad and fertile plains have no fixed market value.

The existence of this state of things is well known abroad; and hence it is that emigrants fail to reach our shores in numbers at all commensurate with the relative inducements which our natural advantages hold out. We neglect the first important requisite for establishing these real evidences of prosperity, *in failing to help ourselves*. We ask for foreign capital to come here and establish manufactories; to purchase farms at speculative prices, and stock them; to open our mines—that is, those of doubtful value—and to forward all other branches of legitimate business, while we employ our own surplus capital mainly in speculation, and in doing those very things the natural tendency of which is to discourage legitimate business and that very emigration which we profess to so earnestly desire. The remedy for these evils will be considered next week.

In Memoriam.

Died—At Middleboro', Mass., on Monday, the 4th instant, Rev. Seth Ewer, aged 78 years and 5 months.

Like the rushing of mighty waters came the memories of more than half a century as we read the brief telegram announcing the above sad record. Childhood, youth and manhood, were passed in quick review, bringing to our mind fond recollections of the tender guiding hand that led our early footsteps, the strong arm that shielded and protected us in later years, and the fatherly care that counselled us aright as we went forth, inexperienced, to encounter the wiles and dangers of an unfeeling and selfish world.

Though warned of Death's approach, and though almost a decade had already been added to his allotted age, still Hope whispered the cherished anticipation that we should yet once more behold the form and enjoy the smiles and counsels of a cherished parent. But the summons came—the silver cord was loosed and the golden bowl broken at the fountain.

An only son, in his loneliness, feels the blow in a distant land, and seeks to pay the tribute which affection prompts. As these feeble and imperfect lines are passing through the press, in California, the tolling bell of a New England village tells of a slow-moving hearse, followed by weeping mourners, bearing to the tomb the mortal remains of a loved one, whose spirit, after more than fifty years of labor in its Master's cause, has passed to its "eternal rest." As a little circle of weeping friends gather around the family altar, in this far-off Pacific home, we almost fancy we hear the solemn toll, the sob and the groan. In spirit we press forward to the weeping train—we lift the lid, gaze upon the inanimate form, then close it forever from mortal view, and drop the green token of an affectionate farewell upon the last resting place of—My Father.

The counsels and prayers of pious parents are a priceless legacy. They are like the refreshing dews which first ascend from earth heavenward, and then descend to bless and revive. A home, where father and mother, brother and sister, have a unity of interest, sympathy and affection, becomes in mature life sacred in memory's shrine beyond all else of earthly name. When, in passing years, the destroying angel once and again and often, perhaps, crosses its threshold to silence some familiar voice in death, how does memory carry us back to childhood days, and force upon us the realization that the home of our childhood, however humble it may have been, was the brightest, greenest spot in the pathway of life!

Home! What a blessed harbor of rest and enjoyment is implied in that little word. Its enjoyment on earth is but a foretaste of that better home, "not made with hands," "where the weary are at rest and the wicked cease from troubling." Infidelity may array itself against the Bible; it may meet us in all the outward walks of life and be loud and clamorous in the public assembly; but it has neither the courage nor power to enter the sanctuary of that home where a pious mother teaches infant lips to pray, and a religious father points his children to the throne of God.

One o'clock to-day (Saturday) is the time fixed for the blowing up of Blossom Rock.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending March 29th.

Medical Compound.—Philester Lee and Lemuel Matthews, Lebanon, Oregon.

Wagon-Brake.—Michael Howell, Umatilla, Oregon.

Caster for Sewing Machines.—John M. Veasey, Denver, Colorado Territory.

Water-Closet Valve.—Curtis T. Forrest, San Francisco.

Carriage-Axle.—George A. Lloyd, San Francisco, assignor to himself and Anthony Rosenfield.

Pump-Piston.—New England Pump-Manufacturing Company, Boston, Mass., Pacific Pump-Manufacturing Company, San Francisco, Cal., Charles F. Mudge, Bridgeport, and Bridgeport Manufacturing Company, Bridgeport, Conn., assignees, by mesne assignments, of Nathan Stedman. Patent No. 41,543, dated February 9, 1864.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Ledger Index.—C. A. Fitch, San Francisco, and W. O. St. John, Oakland, Cal. The object of this invention is to provide the book-keeper with a convenient index book, which is arranged with ruled pages, each leaf being sufficiently stiff to support itself, so that, when it is raised, it will stand vertically in a convenient position to display the names. It consists essentially of a case or cover, of the shape of a book with one end and one edge open, divided into compartments for the different letters of the alphabet. In these compartments are sheets of suitably stiff paper, lettered at the upper edge with metallic or other tags, and secured at one corner by a bolt or rivet. To use this device, the book-keeper needs only to take the sheet with the proper letter and turn it to a vertical position, the sheet revolving on the above mentioned bolt, thus saving time in turning over the leaves of a common index, and obviating all soiling of his book by frequent use.

Improved Bolster and Axle-Bed Plates for Wagons.—J. Henry, Suisun, Cal.—This is an improved device to be applied between the front axle-bed and the bolster of a wagon, and which will serve as a turn-table for the front wheels to turn on as a pivot. The device consists essentially of two plates with projecting flanges on the sides, which are fastened, one to the axle-bed and one to the bolster of the wagon. On the middle of each is a circular plate, the lower having a convex and the upper a concave surface, so that they can rotate on one another. To keep them in place, the upper one is provided at the center with a short pin, which fits in a corresponding socket in the lower one. By the use of this construction, which can be applied to any kind of wagon, the board and the king-bolt are entirely done away with. The bolster can at any time be removed from the axle by simply removing the bolts which pass through the flanges. The weight of the metal and the cost of construction are not increased, and there are no parts which are liable to get lost.

Extracting Copper and other Metals from their Ores.—N. Haskell, S. F., Cal. This process consists in slowly leading water upon heaps of ore and collecting this water, after it has passed through the heaps, and re-using it again in the same way at intervals of three or four days, the ore mentioned being exposed to the action of the atmosphere until all the copper has been extracted. The metal contained in the solution can be precipitated in the usual way at any stage of the process required. Moreover the solution of copper in the collecting tubs or reservoir can be utilized by inserting the poles of a battery and by a course of electro-plating, depositing the copper on various articles and manufacturing copper goods and materials.

Ores from Tem Piute.

We have been shown, by our old friend Col. J. H. Baker, of Placer county, some very rich specimens of silver ore from Tem Piute district, Southeastern Nevada, where he has spent the last six months. He gives us a glowing account of the richness of that district. From our knowledge of the man, however, we accept it without hesitation; believing, that rather than exaggerate the facts, he would prefer to keep back a part of the truth. We give here some notes made during our conversation with him. This district, which has been less talked about than some of less merit, was discovered one year ago last month. It is in Lincoln county, 150 miles due south of White Pine, and 60 miles west of Meadow Valley, or Ely District. The veins are in some instances very large. The principal "dyke," called the Sleeper, is fully forty feet in thickness, and plainly traceable for seven miles. The Wyandotte lode is from six to eight feet thick, and can be followed three and a half miles. The ledges are in most cases nearly perpendicular, and are generally well defined. The ores are sulphides and chlorides. Besides the two ledges named above, the Amy Bond, Younger Born, Prodigal, Cliff, Enterprise, Cadwalader and Mint, are among the prominent ones. The first three of these, forming a group together, have been consolidated, and a company formed in this city to work them, under the name of "The Tem Piute Mining Co." The Amy Bond is extremely rich. From a width of 30 inches at the surface, it expands to three feet at the depth of eight. The other two of the group are apparently about the same size, but have not yet been sunk upon to the same depth. A few hundred pounds of rock from the Amy Bond and Younger Born, crushed at Hamilton, yielded by working process, at the rate of $791 per ton.

Articles of incorporation were filed April 5th. The incorporators are—J. H. Baker, E. Caldwell, H. E. Highton, Jasper O'Farrell, C. D. O'Sullivan, Robert Tobin, and E. T. Bowen. These claims include 3,600 feet in all. The capital stock is in 28,800 shares, at $100 each. One half is set apart for a working capital. Four thousand shares are already taken by friends of the locators. The property will be energetically worked at once, under the superintendence of Col. Baker, who will be on the ground by the first of May. For the outlay already made Col. B. will be reimbursed out of the half stock set aside. The laws of the district have been fully complied with in every respect in regard to each of these claims, and the titles are perfect. A mill for custom work will be erected in the district during the spring, by San Francisco parties, whose arrangements are, we understand, already made.

Col. Baker proposes also to organize another company, on a similar basis, to work three other claims, which form a second group, about one mile from the one of which we have spoken. These three are the Sleeper—the 40-foot ledge; the Cliff—which is on the Wyandotte lode aforesaid; and the Mint—of which last but little is yet known from actual working. Assays of the Sleeper have gone as high as $5,000; no working test has yet been made. A streak of it, about sixteen inches thick, is very rich. Col. B. believes that the whole forty feet will average in mill one hundred dollars to the ton. Assays of Cliff ore are nearly as high as those of ore from the Sleeper. The Enterprise, a 30-inch lode of very rich ore, may perhaps be substituted for the Cliff, and the Cadwalader for the Mint, in this arrangement. Three hundred and fifty pounds of ore from the Enterprise yielded by mill process, at Hamilton, at the rate of over $800 to the ton. A similar test of ore from the Cadwalader gave $489. In case the second company should be organized, as is intended, Col. B. will, if it be the pleasure of all concerned, superintend for the present the operation of that also. A sufficient amount of ore to make a test satisfactory to all, will be sent to this city for reduction. We shall expect soon to see the bullion bricks, which will tell their own story.

We are glad to be able to chronicle the good fortune of Col. Baker. He deserves it. He is a pioneer of '49; and although in early days successful, of late his fortunes have been broken. To mend them, he left his family and his *library*,—no small effort *that*, to him,—and went out alone into the wilderness. Although he had never put in a blast in his life, he doffed his coat, and went at it with a will. Such men are bound to win at last. And now he has "struck it." We congratulate him.

Raising and Moving Buildings.

Quite lately the raising of a building on California street by means of hydraulic power attracted considerable attention and served to make the time fly more quickly for the street-corner frequenters. Although nothing in the process was new, still it may have slipped the memory of many that the plan of raising buildings by hydraulic pressure is a California invention.

Fig. 1 shows the Duncan Building, which the Messrs. Stratton Brothers have been raising. The weight of the house is about 3,000 tons, and this was raised 9 feet 7 inches in the space of five days. While actually at work, the average lift was six inches per hour. Under the four walls of the building were placed thirty-three rams, and the partitions were raised by jack screws.

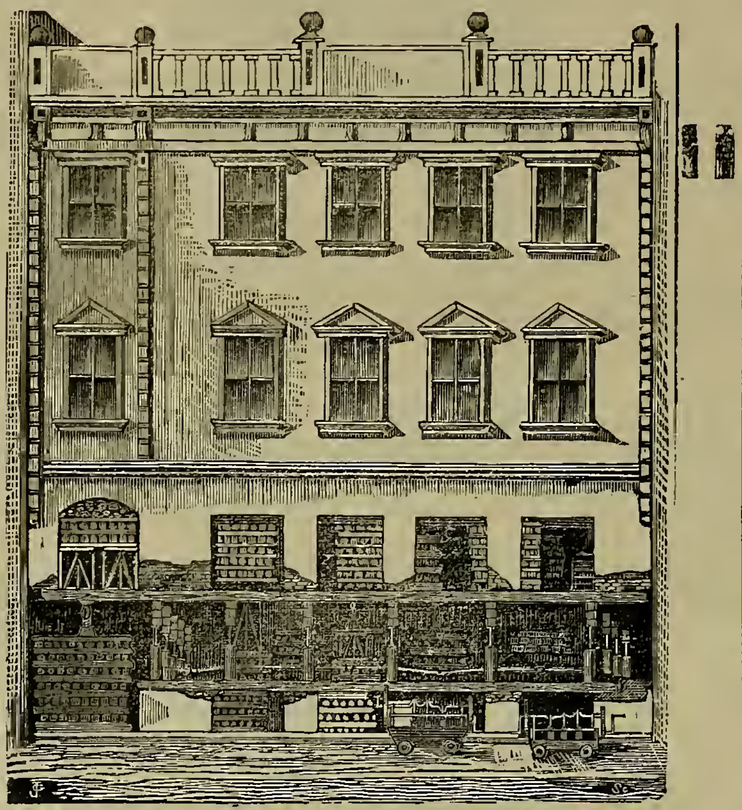

Fig. 1.—Raising Duncan's Building on California Street.

California is the first State in the Union which has turned out a manufactured article of silk, produced entirely from her own soil, and from her own looms. We refer to the late manufacture of the two American flags—one for our State Capitol and the other for the National Capitol at Washington—a most happy idea for signalizing one of those peaceful victories which are generally of more importance to a nation than victories gained upon the field of battle. California has literally begun the silk business *ab ovo*. All the silk manufactories of the Atlantic States spin and weave from imported raw silk.

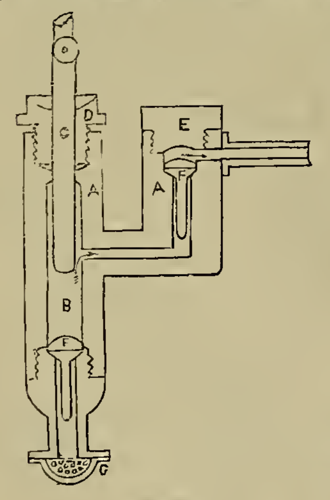

Fig. 2.

Fig. 2 shows a section of the pump cylinder, and Fig. 3 one of the rams of the machine used. This device was invented in 1853 by Messrs. Gordon and Steen of this city. It has been very extensively used here, and when the Messrs. Stratton went to Chicago they carried it with them. In Fig. 2, A is the wall of the cylinder, B the interior or bore, C the plunger, D the stuffing-box, F the valves and G the strainer. The arrows indicate the direction of the water current. Connected with the pump are copper pipes leading to the rams, Fig. 3. Here A is the chamber of the ram, B the walls, C the piston and D the valve. The piston can be raised 18 inches in one operation. The plungers are driven by connecting-rods on the cranks of a driving shaft. There are three plungers to each machine, and these are so arranged that the pressure is exercised continuously.

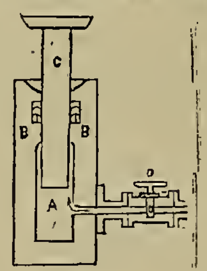

Fig. 3.

The Messrs. Stratton Brothers have long been at work in this city, and have raised some 800 buildings within the last fifteen years. One of the largest buildings ever raised in the city was the block on the corner of Davis and California streets. This was a warehouse, 137½ feet square, filled with heavy goods, and weighed 20,000 tons. A very delicate operation was the righting of Livingston's building on the corner of Battery and California. The earthquake a year ago last October had caused this to settle in such a manner that the northwest corner had sunk twenty-two inches deeper than any other part. The work was conducted very skillfully and succeeded perfectly. The building on the corner of Pacific and Kearny street was raised about two feet and moved thirty, when Kearny street was widened. And here we may call attention to the fact that moving a house in a horizontal direction is a very different matter from moving it vertically. The largest building ever moved horizontally, as far as we know, was the Hotel Pelham, at Boston, Mass., which was moved back 13 feet 10 inches in August, 1869.

It is claimed that in this city more is done in this branch of engineering proportionally than in any other city. At least California has taken a high stand in such work.

◆

A New Hay Press.—We have been shown a model of a new hay press, which promises to be a very valuable invention for farmers. It was invented by Mr. C. Talbot Clark, of San José, who has been at work endeavoring to perfect such an apparatus for six years. It consists essentially of a box or chamber in which are two followers connected by a long screw. In the middle of the box is a pinion, whose hub forms a nut for the screw, and which is fastened so as to admit only of a rotary motion. This pinion being driven by connecting wheels, the followers are moved to and fro in the chamber as desired. Thus one side of the chamber being full of hay, this is compressed by the motion of the follower, and in the meantime the other side is filled. The first being pressed, the wheels are reversed, and the second follower operates, and so on. It is claimed that a bale can thus be pressed in a very short time; if necessary, in eighteen seconds. The whole apparatus is mounted on wheels, and can be easily transported from place to place, and the machine operated by two horses, or perhaps even by one.

◆

The Earthquake last Saturday met with its accustomed success in frightening people, but otherwise occasioned no damage. It occurred at 11 o'clock 48m. 30s. a. m., lasted six seconds, and had a direction of southeast and northwest. Its most vivid effect was felt in the office of the Scientific Press, where it incontinently hurled a large number of Professor Rowlandson's pamphlets on the *Causes of Earthquakes* at the head of one of the clerks who was passing out of the office door in a graceful but expeditious manner. Persons desiring to obtain the pamphlet in question will apply soon, as judging from the result of Prometheus' stealing fire from heaven, the next shock will swallow up the books. What will become of the clerk is at present a matter of profound speculation.

◆

Smoke-Consuming Engine.—The improvement for consuming smoke, invented by E. Daley, was applied to the locomotive "Sacramento," on the trip between Sacramento and Oakland. The cost of the application is given as less than $100, and the engineer states that the saving of coal was from 25 to 33 per cent.

◆

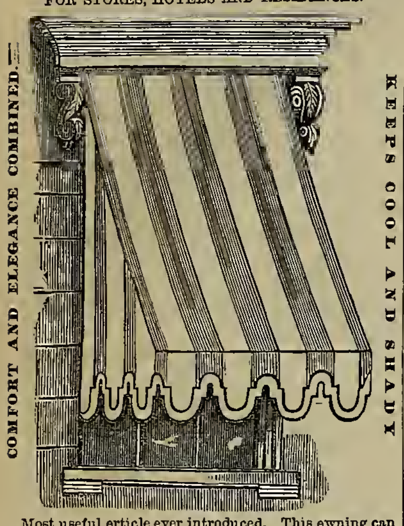
N. Y. Manufacturer and Builder.—Ten dollars cash premium is offered for a club of twenty subscribers, at $1.50 each, to this popular low-priced monthly, by Western & Co., publishers, 37 Park Row, New York.

◆

Reports come of another stampede from San Diego to a new locality, twenty-five to thirty miles south of Julian City, in the Cuyamaca mountains.

Newly-Improved Venetian Awning,

FOR STORES, HOTELS AND RESIDENCES.



Most useful article ever introduced. This awning can be applied to the outside of any window without marring the wood-work or detracting aught from the beauty of the architecture. By the appliance of the new Patent Slide, the awning is made to come low enough to shade the longest window to the bottom, thereby protecting everything in the room from the sun, allowing a free ingress of air through the open window and giving abundance of light. Manufactured from different kinds of goods, colors and stripes, according to price and fancy, by the sole proprietors and manufacturers, J. J. WITHERS & CO., Room No. 2, up stairs, 412 Pine street, San Francisco, 11v20-3m

---

SAN FRANCISCO

Gold and Silver Plating Works.

QUARTZ MILL MEN,

Miners, Hotel-keepers and Others,

ATTENTION!

The SAN FRANCISCO PLATING WORKS are prepared to furnish and silver-plate Copper Amalgamating Plates of all sizes, and in any quantities, at the very lowest rates. FULL WEIGHT OF SILVER deposited, and satisfaction guaranteed in every respect. Particular attention given to plating goods for BUILDERS, PLUMBERS and GUNSMITHS. OLD Goods of all kinds re-plated for hotels, restaurants, etc.

☞The finest quality of Sheet Copper expressly for mining purposes furnished and cut to any size at the lowest rates. A full assortment of Plated Goods and Cutlery for sale at low rates.

E. G. DENNISTON, Proprietor.

HAVILAND, HOOPER & CO., Agents, Crockery and Glassware Dealers, 335 Pine street, near Montgomery San Francisco.

☞All work done at the lowest prices. 1v20-3m

PURIFY your Blood with Hall's Sarsaparilla, Yellow Dock and Iodide of Potass, the best Spring Medicine in use. For sale by all Druggists.

SAN ANTONIO

PIONEER POTTERY.

DANIEL BRANNAN, Proprietor.

A Complete Assortment of

STONE WARE,

Such as Churns, Butter Pots, Preserve Jars, Jugs, Beer Bottles, etc., etc. Also

Chemical Ware, of Sorts Made to Order.

We manufacture to order

Terra Cotta Equal to the Best French.

Samples on hand.

FIRE BRICK.

A No. 1 article made to order, warranted superior to any imported.

Flower Pots and Ornamental Vases

Of all sorts and sizes. 200,000 on hand.

With our patent machinery and superior workmen we challenge competition.

Also, FIRE CLAY, MODELING CLAY and FIRE SAND, all of extra quality, for sale.

☞Orders promptly attended to, and goods put up and shipped with care to all parts of the country.

Brooklyn, Alameda County.

8v20-tf

I. O. O. F.

THE NEW AGE,

A WEEKLY JOURNAL OF SIXTEEN PAGES.

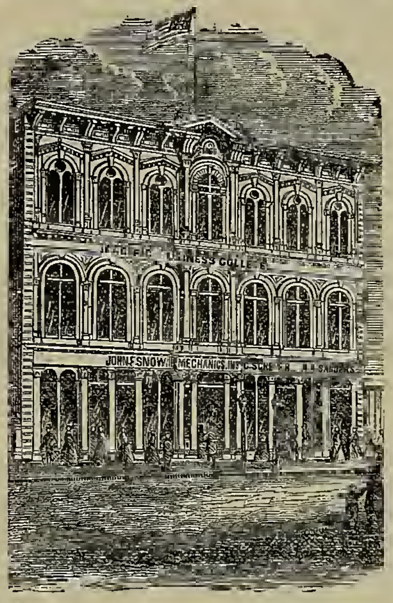
The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the ARTS AND SCIENCES and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, $5. Delivered in the city, per month, 50 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco, 19v19

PACIFIC BUSINESS COLLEGE,

Mechanics' Institute, 27 Post Street,

BET. MONTGOMERY AND KEARNY, SAN FRANCISCO.



THE PIONEER AND ONLY BUSINESS COLLEGE

On the Pacific Coast where BOOK-KEEPING is taught as practiced in the Counting-room.

PENMANSHIP.

In this useful and very important branch we challenge competition.

PROF. SEREGNI

Has obtained First Premiums at all the Fairs on this coast where his Penmanship was exhibited, and was awarded the MEDAL at the Seventh Industrial Exhibition of the Mechanics' Institute in 1869 over all competitors. His success as a Teacher is unequalled.

TELEGRAPHING.

The only place in the city where Telegraphing is taught by an experienced Operator.

We cordially invite the public to call and examine the merits of the College. Our Institute is patronized by the youth of fifteen and the man of fifty, where they receive instruction in Single and Double Entry Book-Keeping, Commercial Arithmetic, Commission Jobbing, Business and Ornamental Penmanship, Commercial Correspondence, Actual Business, Merchandising, Banking, Importing Railroading, Steamboating, Mining, Real Estate, Brokerage and Exchange, Mechanical and Architectural Drawing, Telegraphy, Orthography, French, Spanish, Italian, German and English Grammar. No CLASS SYSTEM. Each student receives individual instruction. No Vacations.

Sessions Day and Evening.

12v20-12t VINSONHALER, JULIAN & CO.

Air—Daisy Deane.

'Twas down in the kitchen a turkey she was stuffing,
  And trimming it with parsley fresh and green;
And the kettle on the stove was bubbling and singing,
  When I first met my darling Daisy Deane,
    None knew thee but to love thee, thou dear one of my heart,
      Oh! thy cabbages were ever fresh and green;
    Though the squash pie is gone, and stuffed hearts be eaten,
      Still I love thee, my darling Daisy Deane.

While walking on the levee, she fell into the river,
  And she floundered like a fish caught in a seine;
By the wetting she took cold and a racking cough soon followed,
  It settled on the lungs of my darling Daisy Deane.
        None knew thee, etc.

My bright flower seemed fading, like a rose that had fallen,
  Though they dosed her with pills and kerosene;
For the doctors all agreed she'd die before the morrow,
  Oh! my dear one, my darling Daisy Deane.
        None knew thee, etc.

So down to the drug store I despondingly did wander,
  To end my existence with a glass of glycerine;
But ALLEN'S PECTORAL BALSAM was placed within my grasp,
  Just one bottle cured my darling Daisy Deane.
        None knew thee, etc.

☞Ask for ALLEN'S PECTORAL BALSAM, and see that the proprietor's signature (as below) is written across the wrapper in red ink. SOLD BY ALL DRUGGISTS AND GROCERS.

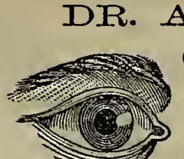
DR. ABORN,



Oculist, Aurist,

AND

CATARRH, THROAT

AND

Lung Physician.

No. 22 KEARNY STREET,

SAN FRANCISCO, CAL.

Testimonials from Well-known Citizens of California as evidence of his success.

Card from Charles N. Fox, Esq., of the firm of Campbell, Fox & Campbell, Attorneys, 528 California Street.

I have for many months suffered from Catarrh, accompanied with unpleasant sensations and sounds in the ears. Recently I found my hearing impaired, and at once applied to Dr. Aborn, No. 22 Kearny street, San Francisco. He improved my hearing almost instantaneously, and now, after being under his care six days only, I feel as if entirely cured, and my hearing is restored. CHARLES N. FOX.

San Francisco (Cal.), Jan, 10, 1870.

Card from S. O. Houghton, Esq., Attorney at Law.

I have been afflicted with severe nasal Catarrh for two years, which a few months since extended to my throat, producing a distressing cough, and seriously impairing my health generally. I have been under treatment by Dr. Aborn, at 22 Kearny street, San Francisco, for about three weeks, and have been already greatly relieved—my cough has almost disappeared and my health greatly improved. By one application, Dr. Aborn relieved me of a very severe neuralgic pain, and with four applications it was entirely cured. S. O. HOUGHTON.

San Jose (Cal,), Nov. 22, 1869.

From Hon. Jas. A. Johnson, M. C., California.

TO WHOM IT MAY CONCERN.—Having been a sufferer with Catarrh and a severe bronchial affection for more than seven years, and having found great relief by submitting myself to Dr. Aborn's treatment for a few days only, I take pleasure in saying Dr. Aborn, with his new and improved instruments for local applications to the lungs, air passages, eyes and ears, should encourage all who are affected in those parts to cherish a lively hope that they may find quick and permanent relief. Very truly, JAMES A. JOHNSON, M. C., California.

A Wonderful Cure.

Having been afflicted for over twenty years with a disease in the left nostril, which has been called by different names—cancer, scrofula and ozena—different physicians have tried their skill in attempting its cure, but without success. It has rendered me incapable of labor for the last two years. Since the beginning of June last I have been in the Sacramento hospital reduced to a mere skeleton. On the 23d of November I left the hospital, and since the 26th have been under the treatment of Dr. Aborn in this city, and the disease is already nearly cured, and my strength and general health very much improved, and I have full confidence of a perfect cure. Already I have gained many pounds in weight, and look and feel like another person. The success of Dr. Aborn's treatment in my case should be sufficient to encourage all who have chronic diseases to make another trial for that good prize—health.

WILLIAM BEARDSLEE.

Pacific House, San Francisco, Dec. 13, 1869.

Another Remarkable Cure.

For the benefit of the afflicted and as an act of justice to the skill of Dr. Aborn, I make the following statement: For about two years I was seriously afflicted with a bronchial affection. I had a distressing cough, difficulty of breathing, expectoration, night sweats, and was losing flesh very rapidly. I was treated by five physicians without any benefit, but continued to grow worse, and was finally advised by them to leave the city, as in their opinions I could not be cured in this climate; but my business relations were such as to preclude a change of climate, although my health was declining so fast that I could not have lived long without relief. Two months ago, when Dr. Aborn arrived, I read his publications and the testimonials of his remarkable cures, which led me to believe that there must be merit in his treatment. So I placed myself under his care, and it is with great pleasure that I am able to say that he has cured me of those distressing and dangerous bronchial affections; also, the night sweats, cough, etc. I was unable to attend to business since April last, until after being under Dr. Aborn's treatment for one week. My improvement was so rapid that in one week's time I was able to resume my business, and I have continued to gain ever since so rapidly that even my friends are surprised at the remarkable results of his treatment.

MARAVILLA COCOA.—*For Breakfast.*—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

Report of Samuel S. Fisher, Commissioner of Patents.—1869.

[CONTINUED FROM PAGE 218.]

Appeals.

[Under this head the Commissioner makes some plain statements regarding the law permitting appeals to be taken to the Supreme Court of the District of Columbia, after a case has already been appealed to a second examination and considered by the First Examiner, to the Examiner-in-Chief, and to the Commissioner, after it is taken from the Patent Office. Conflicting opinions at different times are made by the Judges of the Court. Several ridiculous and mischievous decisions are cited, showing a conflicting system of judgments, which is a growing evil, and calls for abatement. The Act of March, 1869 provides "that the applicant may file a bill in equity in any Circuit Court, having cognizance thereof, 'where patents are refused for any reason whatever, either by the Commissioner of Patents or by the Chief Justice,' and the complainant may obtain a decree authorizing the Commissionor to issue the patent," and we think the Commissioner's recommendation that the appeal to the first named court is a good one.—EDS.]

Drawings.

No part of the machinery of the Patent Office is of more value than the drawings. It is to these, as has been stated, that reference is made by the Examiner, in order to determine the novelty of every new application. Models may be altered, or broken, but the drawings remain unchanged. Under the law, the applicant furnishes one drawing for the use of the office. These are carefully preserved in portfolios, where they can be readily examined. Some of these drawings have been in the office over thirty years. They are handled every day, and have become much soiled and worn; some are nearly destrowed, and all soon will be. Some provisions for their reproduction *must* be made, or the present system of examination must be abandoned. Indeed, under any system, there must be something in the office by which new applicants and the public may known what drawings have been attached to the patents that have been already issued; and whether it be examined by attorneys, or by sworn officials, a single copy of a drawing will soon become worn and useless.

Besides this, as there is but one copy of the drawing in the office, it must be used upon all occasions. It is frequently taken to the examiner's room; it is taken to the room of the examiner-in-chief; it is used before the Commissioner, and must go to the appellate judge. It must be withdrawn from the portfolio whenever a copy is ordered or an applicant wishes to examine a reference.

This multiplies the chance of loss and of destruction, and, what is of more importance, it increases the risk of examination; since the very drawings which anticipates a new application and shows the alleged invention to be old, may not be in the portfolio when the examination is made.

To remedy these evils and provide against the gradual but inevitable destruction of the drawings, at least ten copies should be prepared: one for the use of the examiners; one for the record room where the specifications are kept, and where it would be accessible to the public; one for the library; two for the English patent office, in return for the duplicate set of printed specifications and drawings furnished to us; and five for sale, when copies are ordered.

The English, French, Italian and Belgian governments engrave the drawings of all patents at a considerable expense, and are, in this particular, in advance of this country.

At the beginning of this present fiscal year, as no special appropriation was made for this purpose, and necessity was so urgent, I availed myself of the general authority of the Commissioner to provide copies of the drawings, and of such sum as it was believed might be saved from the amount appropriated for contingent expenses, and entered at once upon the work of reproduction.

For ten copies of the drawings to be furnished weekly, photography appeared to offer the cheapest and surest method. A contract was made in June last, with Messrs. Peters & Rehn, upon terms advantageous to the office, and the weekly issues have been regularly photographed ever since. The quality of the copies thus produced has steadily improved as difficulties have been overcome, and the work has become more familiar; until it is now performed in the most satisfactory manner both to the office and the public.

During the year experiments have been made in other methods of engraving and printing the drawings.

The American Photo-lithographic Company offered, if tracings were furnished, to supply, free of further cost to the office, ten lithographed copies of each of the fourteen hundred drawings of patents granted during the month of June, 1869. This proposition was so favorable that it was at once accepted, and the work has been done in a very creditable manner.

The firm of French, Langran & Ogilive, of this city, made an offer for the drawings of May, 1869, at a nominal price, which was also accepted, and the work, which has thus far been well done, is now nearly completed.

The experiments have led to the conclusion that, for a few copies for office use, photography is the cheapest process, while for a large edition; either for the back drawings or of the current issues, lithography or photo-lithograpy must be employed. An appropriation has been asked for, to make this business of reproduction a prominent feature in the office work.

[TO BE CONTINUED.]

Water Meters.

We've been excited here in San Francisco of late more about the method of getting our water supply than concerning the manner of measuring it. The latter topic has been occupying the minds of many at the East, and came up before the New York Society of Practical Engineering, at their meeting on the 16th ult., and the salient points brought out at the time are communicated to us by the President, Mr. J. A. Whitney:

Measuring the volume of water passing through a pipe would appear to be an easy thing, but that it is not so is proved by the hundreds of devices for the purpose which have been invented and laid aside, and the acknowledged defects of the comparatively small number which have gained even a minor share of public patronage; yet the demand for a perfect meter is very great. In the United States and Canada there are probably a hundred cities and towns with water-works costing in the aggregate one hundred millions of dollars, and in each of which the supply is wasted in the most reckless manner. In New York city the quantity furnished to each user daily is from sixty to seventy gallons, but, notwithstanding this abundance, the waste during the past summer led temporarily to the disuse of water for washing the streets.

Different Kinds Used and Their Defects.

The essential requisites of a practical water meter are cheapness, accuracy, and capability of being attached, not at the faucets, which would require too many meters in a house, but to the main supply-pipe. Among cheap meters are: Screw meters, which act somewhat on the principle of a turbine wheel, with a registering mechanism attached to the stem or shaft; diaphragm meters, in which the water is measured alternately in each of two chambers, divided by a flexible diaphragm, which latter, by its movement to and fro, serves as a substitute for a piston, and also actuates suitably arranged valves, as well as the recording devices; and rotary meters, which are simply small rotary engines, furnished with registering clockwork and dial, and run by the current of water instead of steam. Of these the screw and rotary ones are defective, in that a portion of the water leaks past the screw or rotary piston, as the case may be, and fails to be recorded. The diaphragm meters wear out quickly, the bending of the diaphragm to and fro soon destroying its integrity. Piston meters, more largely used than any other, have too much friction, and are not accurate under varying pressures. Differential meters measure a part of the water, and the proportion of this being known the entire quantity passed through the meter is estimated. This differential system has been applied to screw meters by making, say two per cent. of the water pass through a small turbine connected with an index apparatus; by multiplying the quantity thus recorded by fifty the whole quantity would be shown. This, however, possessed the double defect of not registering all the water that passed through the small meter, and of difficulty in exactly proportioning the size of the smaller to that of the larger division of the water.

Dr. Hall's Experiments.

At the regular monthly meeting of the New York Society of Practical Engineering, held in the Cooper Union, Wednesday evening, March 16th, Dr. A. W. Hall described a series of experiments undertaken with a proportionate meter on a different principle. These tests had extended over a period of two years, and had cost about two thousand dollars. The result was that the plan, except for cheap faucet meters, was given up for the screw system, which the writer believed could be made accurate and durable by making the body of the screw hollow to bring its specific gravity very near that of the water, so as to diminish weight and wear upon the bearings, and by so arranging the parts that any flow of water, aside from the screw, would be so retarded as to be practically nullified, by which means, he claimed, the entire quantity would be made to act upon the vanes of the screw, and through them upon the registering device.

The proportionate or differential meter experimented with was constructed with two valves, actuated simultaneously to divide the water into two streams of definite proportions. The smaller stream flowed to a small dumping meter, where it was measured, and, being duly registered, indicated the entire quantity. The ratio of water passed by the two valves varied, however, under different pressures, and when a pressure equalizer was applied to remedy this, small particles of dirt obstructed the orifice of the small valve, and spoiled its working. Furthermore, the extra expense of a pipe to carry away the water from the measuring or dumping meter made the cost too much. From the above it will be seen that the solution of the meter question is yet a good ways off, and the device really needed has not yet been made.

◆

ON THE WAR TRAIL.—The citizens of South Pass, Wyoming, have formed two mounted companies to avenge the death of the miners murdered lately by the Indians.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, $7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

LAYRES' ELEMENTS OF COMPOSITION.—This is a valuable book of 166 pages, containing plain and simple instructions in the art of composition. It should be read by all intelligent persons who desire to write or speak English correctly or eloquently. Printed and sold by Dewey & Co., Scientific Press Office.

ABSOLUTE DIVORCES legally obtained in New York, Indiana, Illinois and other States, for persons from any State or country, legal everywhere; desertion, drunkenness, non-support, etc., sufficient cause; no publicity; no charge until divorce obtained. Advice free. Business established fifteen years.
Address, M. HOUSE, Attorney,
14v20-3m No. 78 Nassau street, New York City.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24w

TREATMENT OF REBELLIOUS SILVER ORES, by Charles H. Aaron—a pamphlet of eight pages, of concise reading, of practical value to parties interested in the subject. Printed and sold by Dewey & Co., at this office, for 25 cents, post paid.

BUSINESS FORTUNES are often made easily, quickly and legitimately by Patent Rights. We advise both sellers and purchasers to patronize reliable agents only. Weister & Co., patent brokers, No. 314 Bush street, San Francisco, are one of the most honest, reliable firms in the United States. *

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

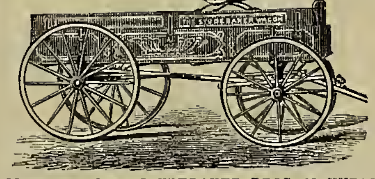
Rooms: McFadden's Block, corner Montgomery and Market streets. Se habla Español. On parle Français. 15v20

The Celebrated Studebaker Wagon,



Manufactured by STUDEBAKER BROS. MANUFACTURING CO., South Bend, Indiana. WAGON DEALERS, there are nine reasons why you should buy the above Wagon:

FIRST.—They are made of the best selected INDIANA TIMBER, thoroughly seasoned under cover. SECOND—They are made by experienced mechanics. THIRD—The lightest running and most durable Wagon in the market. FOURTH—Their Thimble Skeins never break, while all others do. FIFTH—Most uniform and best proportioned Wagon in the market; any part of one will fit another, while other makes will not. SIXTH—The only Wagon in which the SLOPE SHOULDER SPOKE is used; hence they have the best Wheel, which is actually the foundation of the Wagon, and should be carefully examined by persons buying. SEVENTH—They are sold only by responsible parties, and every Wagon is warranted to give entire satisfaction. EIGHTH—Because Teamsters will tell you they are the best Wagons, for all purposes, on the road. NINTH—Last, but not least, Studebaker Brothers are practical men, attend to their business personally, and do not entrust it entirely to foremen, as is generally the case in large factories; hence the superiority of their work over all others.

Sold by COPELAND & DEFREES, K street, between Seventh and Eighth, SACRAMENTO, CAL. ☞ PIONEER AGENTS FOR THE PACIFIC COAST. 15v20-3m

Patent Brokers.

WIESTER & CO.,

PATENT BROKERS,

314 BUSH STREET,

SAN FRANCISCO.

Patents Bought and Sold on Commission.

For the benefit of those who live at a distance from the city, we give below a brief description of a few of the valuable Patents which we have in our office. It may be well to state here that no Patent is received by us for negotiation until it is first endorsed by reliable experts, to whom each is subjected for acceptance or rejection. We treat all patents alike, recommending only where true merit is found in the invention.

BURGESS' PATENT PAPER FILE.

This is a recent patent, and one of no ordinary merit. It is light and complete, yet costs but little. In all file-holders before presented to the public, the papers are very liable to tear, or else the method of inserting them requires too much time and trouble. This device is easily adjusted, is not liable to tear the paper, nor let it loose. This patent is also used in combination with covers for forming music folios. Musicians who have seen it, speak in the highest terms of its value. No person can fully appreciate the Paper File or Music Folio without seeing one.

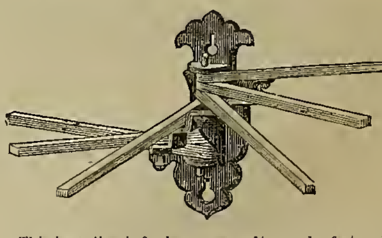
THE RANDALL RAKE.

Here is an article that we take pleasure in recommending. This patent has been for some time on this coast, but for want of means has been allowed to remain comparatively quiet. It will require from four thousand to six thousand dollars to handle this invention successfully on the Pacific Coast, and we would advise any one with this amount of capital to look into the merits of this patent before embarking in other business. We cannot see why it will not eventually supersede all other horse rakes. It does its work completely and is easily operated. It is so constructed that the teeth play on an iron rod independently of each other, and therefore accommodate themselves to any surface. The inclination of the teeth to the surface prevents them from raking up sand and dust with the hay, and causes them to glide easily over the ground. The driver has a spring seat to sit upon, and a simple action of the foot is all that is necessary to drop the hay. A complete model can be seen at our office, or references can be had to parties who have them in use on their farms.

LIGHT.

A Lamp that makes its own gas and burns it. No chimneys are required. It is equal to the best coal gas, and costs fifty per cent. less. Agents get the lamps at manufacturer's prices. This new light can be seen at our office, 314 Bush street, San Francisco. The Right for the State of Oregon will be sold cheap.

HOTCHKISS' CLOTHES DRYER.



This invention is for house use. It can be fastened to the wall with two screws, and removed without taking them out. When not in use the arms can be folded closely against the wall. Each arm has an iron brace to support it. This is really a "good thing in a family." County or State rights for this will be sold very low. Full particulars given on application.

A NEW SEED SOWER,

That can be attached to the Randall Rake at a cost of a few dollars, and is guaranteed to sow as well, if not better, than any other Sower in use.

A neat and convenient CUPBOARD LATCH, that answers equally well for single or double doors. It is suitable for Wardrobes, Wash-stands, Cupboards, etc.

A LOCAL AGENT wanted in every town on the Pacific coast to sell patent goods

WIESTER & CO.,

11v20 314 Bush Street, San Francisco,

San Francisco Metal Market.

PRICES FOR INVOICES.

USE
DR. S. GIRARD SMITH'S
ARAMIRACULAS
—FOR—
RHEUMATISM, GOUT AND NEURALGIA

CURES GUARANTEED.

Has cured Thousands. Has never been known
One bottle will relieve you.

OFF . 621 KEARRY STREET.

Agents Wanted in every City and Town.—Terms Liberal.

DR. S. GIRARD SMITH, 621 *Kearny street.*—Dear Sir It would be hard for me to say how much I thank you for the benefit your ARAMIRACULAS has conferred on me in curing my RHEUMATISM. I was confined to my bed when I first commenced to take your medicine, and after using ONE BOTTLE I am now able to work as well as before. If you know anything about having that afflictive complaint, you must know how good it is to be cured. I will state to those who may not believe in your medicine, that they can be convinced by referring them to me. Very respectfully, yours,

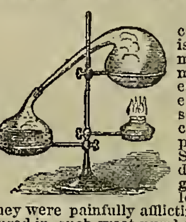
ENON HARRIS,
Everard's Auction Rooms, 527 Kearry street.

Statement of an old and well-known Physician who has practiced extensively in Europe and America.

We must admit that the many systems of medicine by which we have attempted to heal the human body, and rid it of disease, from the science of ALLOPATHY down to HYDROPATHY, how little they have succeeded, time has abundantly shown by their number of failures. In the cure of RHEUMATISM, GOUT and NEURALGIA, Dr. S. Girard Smith has laid aside the old way and adopted a system, so simple, that I must admit, is so natural and direct, that it recommends itself to all who are suffering with the above diseases. And it challenges and defies all the old methods of treatment. Although I have been educated through a regular course, and graduated in Europe, I must acknowledge the right, and also give due credit for personal benefit received by the new system as practiced by DR. S. GIRARD SMITH, which induces me to bear this testimony to its merits, for the benefit of suffering humanity.

A. M. HOFFMAN, M. D.,
11v20-3m New Orleans.

Ayer's Sarsaparilla,
FOR PURIFYING THE BLOOD.



The reputation this excellent medicine enjoys, is derived from its cures, many of which are truly marvellous. Inveterate cases of Scrofulous disease, where the system seemed saturated with corruption, have been purified and cured by it. Scrofulous affections and disorders, which were aggravated by the scrofulous contamination until they were painfully afflicting, have been radically cured in such great numbers in almost every section of the country, that the public scarcely need to be informed of its virtues or uses.

Scrofulous poison is one of the most destructive enemies of our race. Often, this unseen and unfelt tenant of the organism undermines the constitution, and invites the attack of enfeebling or fatal diseases, without exciting a suspicion of its presence. Again, it seems to breed infection throughout the body, and then, on some favorable occasion, rapidly develop into one or other of its hideous forms, either on the surface or among the vitals. In the latter, tubercles may be suddenly deposited in the lungs or heart, or tumors formed in the liver, or it shows its presence by eruptions on the skin, or foul ulcerations on some part of the body. Hence the occasional use of a bottle of this *Sarsaparilla* is advisable, even when no active symptoms of disease appear. Persons afflicted with the following complaints generally find immediate relief, and, at length, cure, by the use of this *SARSAPARILLA: St. Anthony's Fire, Rose or Erysipelas, Tetter, Salt Rheum, Scald Head, Ringworm, Sore Eyes, Sore Ears,* and other eruptions or visible forms of *Scrofulous* disease. Also in the more concealed forms, as *Dyspepsia, Dropsy, Heart Disease, Fits, Epilepsy, Neuralgia,* and the various *Ulcerous* affections of the muscular and nervous systems.

Syphilis or *Venereal* and *Mercurial Diseases* are cured by it, though a long time is required for subduing these obstinate maladies by any medicine. But long continued use of this medicine will cure the complaint. *Leucorrhœa* or *Whites, Uterine Ulcerations,* and *Female Diseases,* are commonly soon relieved and ultimately cured by its purifying and invigorating effect. Minute Directions for each case are found in our Almanac, supplied gratis. *Rheumatism* and *Gout,* when caused by accumulations of extraneous matters in the blood, yield quickly to it, as also *Liver Complaints, Torpidity, Congestion* or *Inflammation* of the *Liver,* and *Jaundice,* when arising, as they often do, from the rankling poisons in the blood. This *SARSAPARILLA* is a great restorer for the strength and vigor of the system. Those who are *Languid* and *Listless, Despondent, Sleepless,* and troubled with *Nervous Apprehensions* or *Fears,* or any of the affections symptomatic of *Weakness,* will find immediate relief and convincing evidence of its restorative power upon trial.

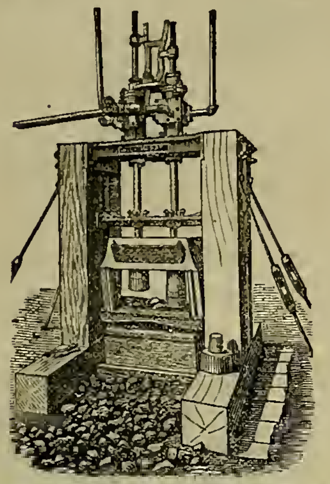
THE WILSON

Patent Steam Stamp Mill.



This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about eighteen months, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

☞ The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

A. BICKNELL, Agent,
Nevada City, California,

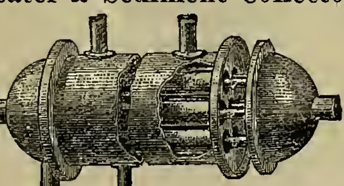
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal

Crandall's Patent Spring Bed.

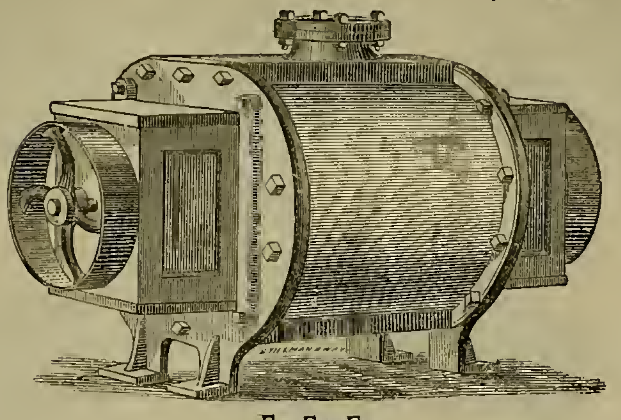
Manufactory, corner Front and M streets, Sacramento COOLEY, HENRY & CO., Proprietors. These Spring Beds, wherever known, are universally acknowledged to be superior to any other in use. They are light, durable and elastic, and present no harborage for bugs or any other kind of vermin, thus being free from the objections so often urged against the ordinary spring beds. ☞ Orders received at our manufactory, or at our agency in San Francisco. 7v20-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

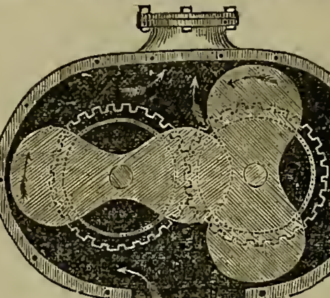
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

Caution.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,
1v1 San Francisco.

Scientific Press.—Dewey & Co. are the publishers of this sterling paper. It is devoted to the dissemination of mining, farming and scientific knowledge, besides containing miscellany of interest.—*Monterey Republican*

FOR SALE.

SAPOINE
FRAGRANT SAPOINE FOR THE TEETH

THE GREAT MEDICAL DISCOVERY!

Dr. J. Walker's California

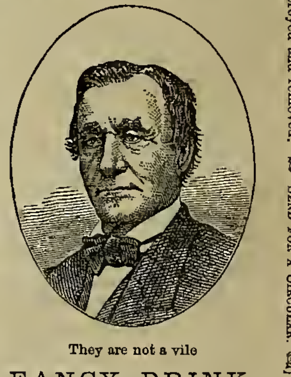
VINEGAR BITTERS.

More than 500,000 Persons

Bear testimony to their wonderful Curative Effects.

WHAT ARE THEY!

FOR FEMALE COMPLAINTS, whether in young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement is soon perceptible in the health of the patient. PIN TAPE, and other WORMS, lurking in the system of so many thousands, are effectually destroyed and removed. ☞ Send for a Circular. ☜



They are not a vile

FANCY DRINK,

Made of Poor Rum, Whiskey, Proof Spirits, and Refuse Liquor, doctored, spiced, and sweetened to please the taste, called "Tonics," "Appetizers," "Restorers," etc., that lead the tippler on to drunkenness and ruin, but are a true Medicine, made from the native roots and herbs of California, free from all alcoholic stimulants. They are the GREAT BLOOD-PURIFIER and LIFE-GIVING PRINCIPLE, a perfect Renovator and Invigorator of the System, carrying off all poisonous matter, and restoring the blood to a healthy condition. No person can take these Bitters according to directions and remain long unwell.

They are a gentle Purgative as well as a Tonic, possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In Bilious, Remittent and Intermittent Fevers, these Bitters have no equal. For full directions, read carefully the circular around each bottle, printed in four languages—English, German, French and Spanish.

One Hundred Dollars will be given for an incurable case, provided the bones are not destroyed by mineral poisons or other means, and the vital organs wasted beyond the point of repair.

For Inflammatory and Chronic Rheumatism, and Gout, Dyspepsia or Indigestion, Bilious, Remittent and Intermittent Fevers, Diseases of the Blood, Liver, Kidneys and Bladder, these Bitters have been most successful. Such Diseases are caused by Vitiated Blood, which is generally produced by derangement of the Digestive Organs.

Cleanse the Vitiated Blood whenever you find its impurities bursting through the skin in Pimples, Eruptions or Sores; cleanse it when you find it obstructed and sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the Blood pure and the health of the system will follow.

WONDERFUL Scientific Discovery.

THE GREATEST EVER MADE,

Having Baffled the Ingenuity of Chemists and Physiologists for Ages Past.

DR. CROWLY'S EMERALD HAIR BALM.

No Exaggeration, but a stern reality, verified by the undersigned:

Dear Doctor:—I feel much pleasure to inform you that your "Emerald Hair Balm" has caused the growth of hair on my head—having only used one of your bottles, although I had been bald for twenty-five years. You are quite at liberty to use this intimation as you please. Yours truly, John Stapleton,
California street, San Francisco.

To W. J. Crowly, M. D., No. 20 Montgomery street, San Francisco. 23v19-3m

To Owners of Horses.

WATSON'S EUREKA SYSTEM.

A GREAT IMPROVEMENT IN SHOEING. Lame, tender or flat-footed horses put in good condition to travel over any cobble stone pavement in the City, in from one to four months. In nine cases out of ten, of what is called Lame Shoulder, Chest Founder and Corns, it is no more or less than the result of bad shoeing, therefore, this system, which is based on scientific principles and practice, remedies the above, and is particularly adapted to all horses working on hard or rough roads, as it keeps the feet sound in all seasons. Quarter crack in any stage cured. No bar shoes used after one or two months. Charges same as other shops. Watson's Eureka Shoeing Shop, Main street, between Mission and Howard. 14v20

PLATINUM

Vessels, Apparatus, Sheet, Wire, Etc., Etc.,
For all Laboratory and Manufacturing Purposes.
H. M. RAYNOR,
57 Bond street, New York.
Platinum Scrap and Ore purchased. 15v20-1y16p

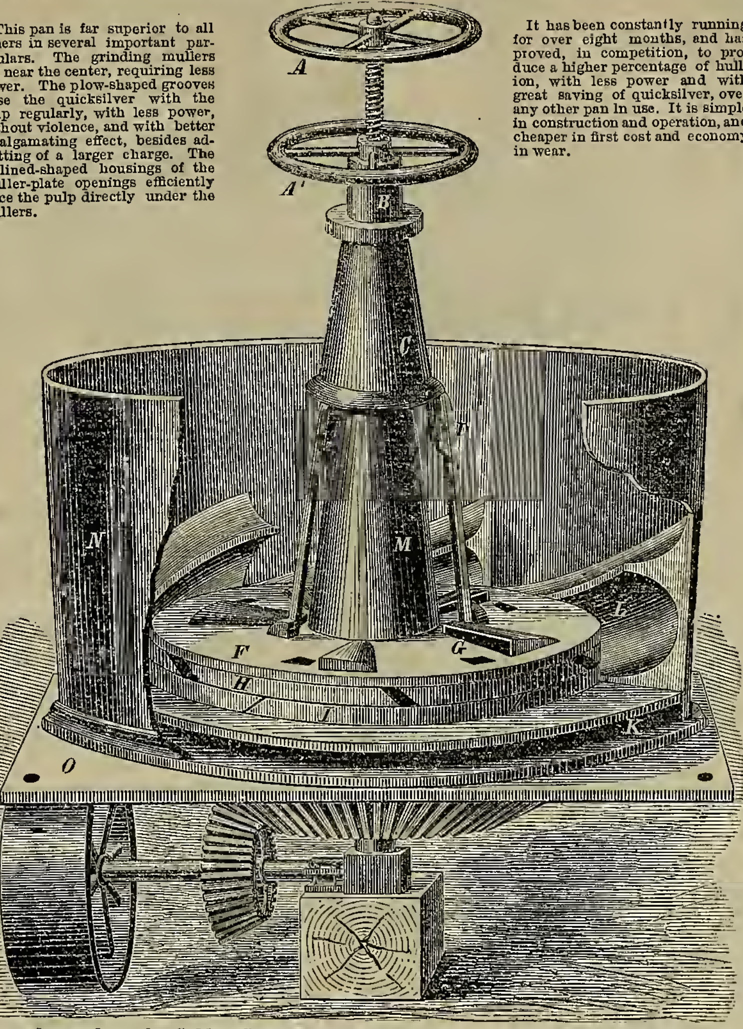
LOST.

Between Market street and the corner of Clay and Montgomery streets, a linen tracing of mechanical drawings representing an amalgamating pan. The finder will be rewarded with one year's subscription to the SCIENTIFIC PRESS—the most valuable illustrated weekly on the Pacific coast—by leaving the drawings at 414 Clay street,
DEWEY & CO.,
U. S. & Foreign Patent Agents.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.



Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.,
Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in constant operation. 15v20-1mr,1amtf

One Per Cent. per Month

Allowed on Six Months' Deposits by the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street, one door from Sansome.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.

Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully; H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in differe special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

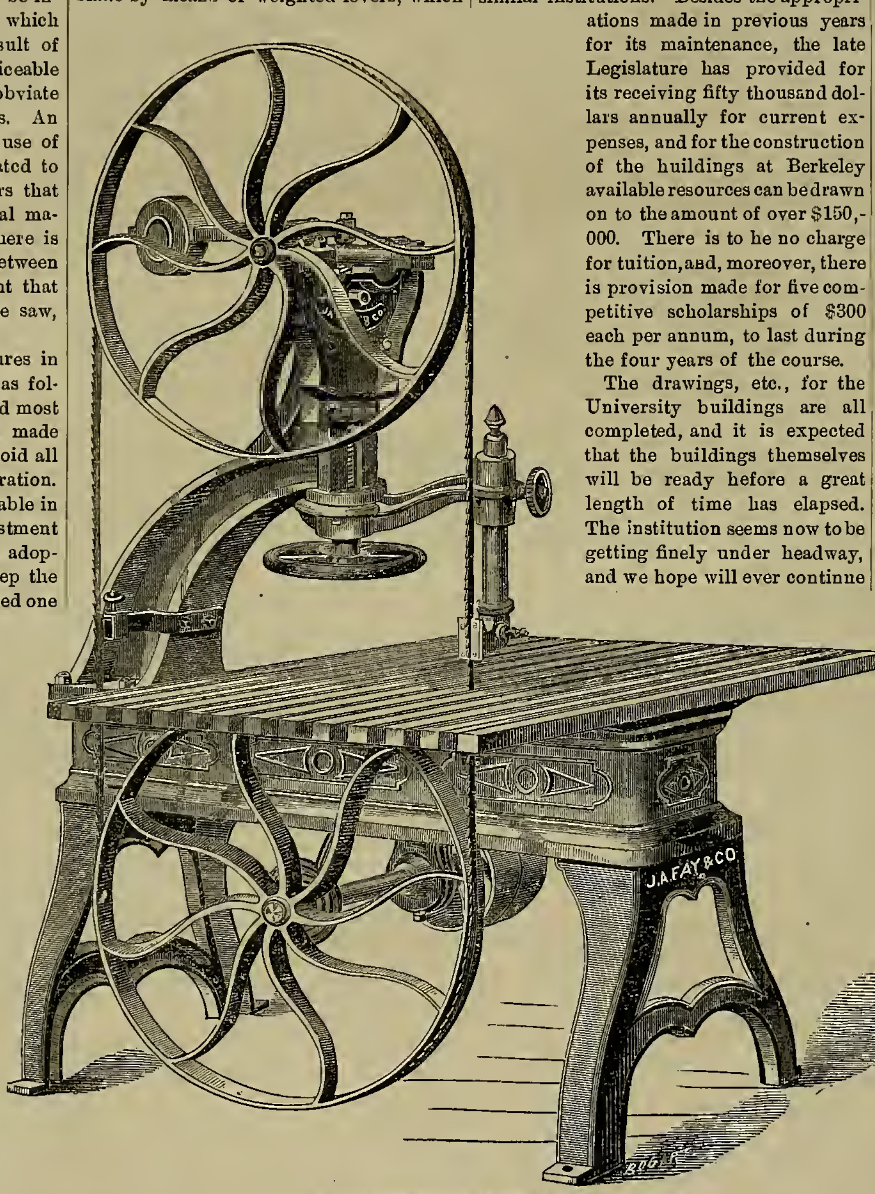
Improved Band Sawing Machine.

Among the sawing machines presented to the public there are many defective ones, a number which are very fair, and several very good ones. Among those which appear to have good claims to be included in the last class is the one which we illustrate to-day. It is the result of years of effort, and has several noticeable peculiarities, which are claimed to obviate many drawbacks of other machines. An experience of fifteen years in the use of these saws in Europe has demonstrated to the satisfaction of the manufacturers that no other than a heavy and substantial machine can operate successfully. There is so much elasticity in the frame between the shafts where the framing is light that an undue strain is necessary on the saw, causing it to break.

Some of the distinguishing features in this machine may be enumerated as follows: The frame is very heavy and most substantial in all its parts, being made wholly of iron and steel, so as to avoid all vibration or trembling when in operation. The lower or driving shaft is adjustable in all directions. A want of this adjustment in ordinary band saws has led to the adoption of flanges on the wheels, to keep the saws in place. Such flanges have proved one of the most frequent causes of broken saws. The top wheel is adjustable independent of the guides, and has a range of 12 inches in its movement. The strain upon the saw is made *constant* by means of weighted levers, and is not affected by the adjusting screw. The new frictionless guides consist of a combination of rollers for the back and adjustable lateral guides for the sides of the saws. These guides are formed of hardened steel-plates, about 3-16ths inch thick, and are placed just below the table, and from their nature are very durable. While the friction common to fixed guides is avoided, these steel guide-plates can be so adjusted as to clip the sides of the saw as tightly or as loosely as may be desired, and, when adjusted, are secured in their position by screws passing through slots formed in them. In these guides the thrust of the saw due to the work being forced against it, is received by the steel roller on the back, and gives rise to roller friction only, so that the back of the saw is not heated, and there is no buckling caused by unequal expansion of the two edges of the saw-blades. This arrangement, it is claimed, renders the machine particularly desirable for cutting thick timber. A machine with these improvements, it is stated, has been operated constantly for two months, reducing the single saw used one-half by wear without any apparent tendency to fracture, and with much less power than with fixed guides, which amounts in some cases to a resistance equal to the sawing. Indeed, it claimed that there is no reason why a saw fitted in this manner may not be worn out without breaking, if properly taken care of. Provision is furthermore made for maintaining an even tension on the saw-blade by means of weighted levers, which are not affected by the adjusting screw, which is also indispensable.



J. A. FAY & CO'S IMPROVED BAND SAWING MACHINE.

This saw is coming largely into use in the East, and the great facility, ease of operating, and very large amount of work which can be done on it, makes it a valuable machine in any planing mill or wood-working shop. It is furnished with English, French or American saw-blades. The machine was patented in June, 1868, by J. A. Fay & Co., of Cincinnati, Ohio, by whom it is manufactured. It may be seen at the machine warerooms of Berry & Place, 112 and 114 California street, in this city, who are the manufacturers' agents, and who will doubtless be pleased to give any further information in regard to it.

The University.

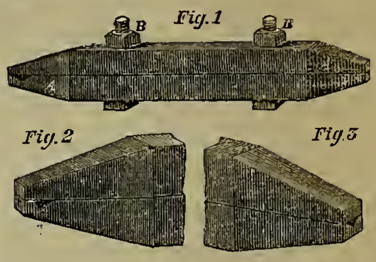
It is to be hoped that our State University will be able now to flourish without the impediment of dire want of necessary funds, which is usually such a drag on similar institutions. Besides the appropriations made in previous years for its maintenance, the late Legislature has provided for its receiving fifty thousand dollars annually for current expenses, and for the construction of the buildings at Berkeley available resources can be drawn on to the amount of over $150,000. There is to be no charge for tuition, and, moreover, there is provision made for five competitive scholarships of $300 each per annum, to last during the four years of the course.

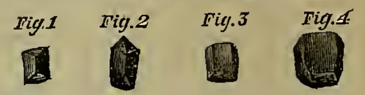
The drawings, etc., for the University buildings are all completed, and it is expected that the buildings themselves will be ready before a great length of time has elapsed. The institution seems now to be getting finely under headway, and we hope will ever continue prosperous. In this connection we may speak of the very interesting course of lectures which have been delivered at Oakland this winter by the professors of the University. These, although most instructive and entertaining, have been but sparely attended. The last one was by Professor Fisher, on the "History and Properties of Gunpowder," and was illustrated by some very beautiful experiments. If Oakland people would attend the lectures once, they would see what they now miss by their absence.

The Board of Regents are to hold a special meeting on June 3d for the election of a President for the University.

Dickinson's Patent Adjustable Tool for Holding Carbon Points.

In the scale of hardness for minerals, the diamond stands the highest, and is, therefore, able to cut all others. This quality has long led to its more or less extended use in the arts; but a serious drawback to its general application has been its cost. The black diamond, however, being valueless as a gem, is comparatively cheap, and being just as useful for the arts, is coming largely into use, and is now employed in very many ways for cutting and dressing a great variety of articles.





The firm of Dickinson has long been engaged in preparing diamonds for such purposes, the business descending from father to son, we are informed. We give an illustration of a tool patented by the present head of the house, for securely holding the diamond in a proper position. Fig. 1 shows the holder, Figs. 2 and 3 being merely the two ends of the same in such a position as to show more clearly the cavities for holding the diamond.

The other figures show some of the carbon points, as they are called in preference, which are quite commonly used. No. 1 is a prismatic point for turning grindstones, emery wheels, etc. No. 2 has an acute point for truing calender paper rollers, etc. No. 3 is used for cutting or sawing stone, for facing or edging ring or cylinder drills and circular saws. No. 4 is for drilling stone, glass, etc.

These points and tools are coming rapidly into use, and growing in favor among machinists and others in all parts of the country. Any information with regard to them may be obtained by applying to John Dickinson, 64 Nassau street, New York.

◆

A Bird Story.—An Eastern paper says that among the Sandwich Mountains in New Hampshire there is a deep glen, thickly covered with evergreens, on the tops of which trees the snow lodges, shutting out the cold winds as well as the light. This secluded spot has been found to be the winter residence of thousands of New England robins, who prefer somewhat restricted quarters at home to southern migration.

Communications.

Mills and Mines of Colorado.—Concluded.

BY ALMARIN B. PAUL.

[Written for the Scientific Press.]

Nevada, Central City and Black Hawk are in such close proximity to each other that in speaking of them it must be as of one place. They are located in the order named, as approached from the south. They form one continuous line of about three miles in length, and, as respects location, put me somewhat in mind of Gold Hill, Nevada. Central City forms the heart of the trade and population, and has quite a number of good substantial buildings.

Want of Hotel Accommodations.

There is a population in these places, in a circuit of a few miles, of 7,000 people. Central is a place of considerable wealth, and yet does not possess hotel accommodations which would rank above common.

The landlord of the principal hotel (Connor House) is clever and accommodating enough, and the table is passable, but the *house*, divested of furniture, would not make, in San Francisco, a second-class Chinese lodging-house, and yet it is $1 a meal and $1 for lodgings, or, in other words, $4 per day. There is nothing like a comfortable and fine hotel to give good impressions to strangers. In this respect Central does not do justice to herself. The enterprise of this section is clearly illustrated in the support of two daily journals—the *Register* and the *Herald*—which distribute daily telegrams from all parts of the world, not excepting the Pacific coast. They are both lively, spirited papers.

The Mills.

As one looks about at the mining interest, he is surprised to see the vast amount of capital that has been expended. I was informed that Boston alone had expended nineteen millions of dollars, though I doubt it—in fact, don't believe it. Yet the expenditure has been so large, that an idea arises in the mind that possibly it might be so. Boston went in heavy on the Crosby & Thompson desulphurizing process, which proved very expensive and unsuccessful.

There are, within a circuit of five miles around Central City, about 700 stamps. To give a review of these mills is a bigger job than I propose to enter upon. They are of all sizes, but few with less than ten stamps, and from that up to thirty. In consequence of the extreme cold snap, but few were running; consequently not as much activity was displayed as during the warmer months. Not half of the stamps, however, run in any month, there having been an overdoing of things in previous years. The mills, as a whole, do not come up to our California or Nevada mills, either in arrangement, thoroughness of working, or general symmetry. They are mostly from the East, and have not the advantage of improvements, which long experience has been able to furnish us with. Here, as elsewhere in the Territories, the dependence is on copper plates and what can be caught in the batteries, which might do where gold is perfectly clean; but on ores such as they work, it is not possible to save as much as could be with other simpler machinery, and at even a trifling additional expense.

The Ores.

The ores washed by these mills, as elsewhere in the Territory, are all impregnated with lead, copper, antimony and zinc, and some, to my eye, seemed more suitable for the furnace than stamps. When one looks at the ore and the mills with such deficient amalgamating appliances, and knows that a few do make it pay, he comes to the conclusion that they must have considerable rich ore. The surface ore, they say, works well; but when that ends their doubt begins. Decomposition relieves the gold in the first case, while the undecomposed base metals prevent amalgamation in the second. There is, no doubt, an abundance of rich ore in this district; the point is to get it out cheaply. Some of the mills have tried pans, but they, only acting as agents for precipitating the base metal, were abandoned.

Loss in Milling.

I have the result of a close investigation, made by a young man of fine metallurgical skill, and of a practical, investigating turn of mind, which, no doubt, closely approaches the facts of the value of Colorado and the mechanical effectiveness. It is as follows: By assay, first-class ore will run from $80 to $100; second-class ore, from $20 to $30; dump piles, $12 to $20. Pretty thorough investigation proves, also, that not over 30 per cent. is extracted, on the average. Another source and many other assays show even a more terrible loss, as follows: 13 per cent. is extracted in the mill; 6 per cent. in the washing; 8 per cent. goes down the creek. By this it will be seen that about all which Colorado capital and labor gets is 20 per cent. of the bullion contained in the ore.

Hill's Works.

There are several furnaces where a close percentage is worked out. The most conspicuous are Professor Hill's, which are situated below Black Hawk, and which I visited and inspected, although I afterwards found that "No Admittance" stood prominent. These furnaces are simply ordinary melting hearths, and work mostly the concentrated tailings from the blankets and buddles. The ore is roasted for the furnace in heaps, which is certainly economical, and run into matt for shipment.

"Professors."

There is one thing quite observable in Colorado, which I must not pass over, as it is important to those ambitious for titles, and that is, when any man presumes to be poeted, he is dubbed "Professor," and, to give all the dignity possible to it, up goes "No Admittance." I even had the courtesy (?) extended to me. "Professor Paul!" would not that sound ridiculous? So I said, "Now, friend, just drop that, if you please. I neither aspire to nor desire the title." Among the old California friends I met there, was *Professor* Hitchena.

Bullion Returns.

Colorado has been understood as a great mining country, but, as I look into the statistics, I find she has been much more of an absorber than a developer. Without going beyond the two years past, and giving them all the advantage of the most favorable features, I found her product of bullion was as follows:

1868.	
Central and vicinity	$1,175,000 00
Georgetown	91,829 35
Elsewhere, say	50,000 00
Total for 1868	$1,316,829 35
1869.	
Central and vicinity	$1,380,000 00
Georgetown	249,854 00
Elsewhere, say	100,000 00
Total for 1869	$1.729,854 00

Among us, where one single company, in either Nevada or California, can foot up as much, it seems nothing to brag of. It is by figures we get a square look at ourselves and conditions. The fact is that Colorado wants an overhauling, reconstructing, revolutionizing. Her whole mill system wants bettering and cheapening, and the way to do it is to introduce Western practice instead of Eastern science. Successful mining is hard-fisted work, and not laboratory play. Colorado has stamps, population and mines enough to produce, at least five millions per annum. Now, why don't she do it?

Humboldt City, Nevada.

Editors Press:—Hastings, Huntington & Co. have made a rich strike in the Yellow Jacket mine, about one mile from town. The ledge, which is three and a half feet wide at a depth of fifteen feet, shows a considerable quantity of silver sulphurets and horn silver. Quite a number of claims have been located here lately, and look very favorable. Prospecting is very lively just at present in this district. Chloride Bill.

* * *

For the first three months of this year there were exported from here 188 tons of silver ore and 228 tons of copper ore, of which latter, 77 tons went to Great Britain and 151 tons to New York; also 5,173 flasks of quicksilver. The receipts of coal from the Mt. Diablo mines were 30,092 tons, making the total amount from these mines (from 1861 inclusive) 677,375 tons.

Letter from White Pine.

[Written for the Scientific Press.]

Editors Scientific Press:—Some time ago you expressed a wish to hear from me on the prospects of this district; and, perhaps, your readers, on the approach of spring, may not be averse to know, from the observations of some one on the ground, what those prospects are. I say "on the *approach* of spring;" for spring, with us, does not begin with March, nor with April, nor even with May; but, from courtesy to the poets, we will assume that spring shall commence on the first of next month. The "April showers" that "bring forth May flowers" here bring only the snowflake; and this peculiar species covers with a white carpet the entire surface in this region.

Mines on Treasure Hill.

But few mines on Treasure Hill have been continuously worked for their ore during the winter; however, a great deal of preparatory work has been performed, and the final cessation of snowstorms will be the signal for the resumption of operations on a large scale.

Many of the mills have been idle a portion of the time, from the difficulty of hauling ore through the deep snow. Others have been stopped because their owners became financially involved, and their property was placed under attachment. This latter was the case with several of the smaller mills.

The hurry and hustle and excitement of last spring no longer exist in White Pine. The consequent waste of time and means which always attends haste, especially the haste to become rich, has also ceased. Those who have remained in the district now know how to "make haste slowly," and, as a natural sequence, the country is being better prospected, and the mines more thoroughly and economically developed, than ever before.

Mines on the Base Range.

Especially is this the situation in the mines of the Base Range—a section of mining ground rapidly growing in importance, as capital, skill and labor are brought into it for its development. Some very productive lodes have been worked during the whole winter, in spite of storms and deep snow; good natural roads and the nearness of smelting works rendering these operations possible and profitable. Among these are the Cadiz mine, owned by the Russell Brothers, news dealers, of Hamilton; the Alta, belonging partly to the Alsop Smelting Co., of which Alsop & Co., of your city, are the agents, and partly to John W. Cooper, of Colorado; the Rulofson, in which, I believe, your photographer has some interest; the Bounty; the Molly Stark; the Miser's Dream; the Imperial, and a few others.

The Ores.

These mines all yield the carbonate of lead and argentiferous galena in abundance, but more especially the carbonate ore. Some of these ores, as those of the Imperial and the Bounty, are impregnated with considerable carbonate of copper; others are more or less degraded by oxides of iron and manganese. But all, without exception, yield a certain percentage of silver, sufficient to pay for extraction, smelting, shipping and refining, and to leave a fair margin of profit to all concerned in their manipulation. The miner, however, as usual, comes in for the smallest share of reward for his labor. By an ingenious system of depreciation, the purchasers of ore for the smelting works contrive to keep the price of ore yielding 50 per cent. of lead and $20 per ton in gold, at the low figure of $12 per ton, and ore which yields $40 and $60 in silver commands no more than $15. At these prices, the miner cannot afford to live very luxuriously. The increasing number of furnaces, however, will make competition in the purchase of ore very lively during the coming summer, and prices will advance materially.

The Furnaces.

Capt. Rawlings, C. Carpenter, F. S. Luther, and Thornburg, of Thornburg & Paxton, have associated themselves together under the name of the Alsop Smelting Co., and have erected a large furnace at Shermantown, where the argentiferous lead bullion is being rapidly run into bars of eighty pounds each. J. R. Partridge and Capt. Magary have three furnaces about three miles from Hamilton. Jones, Hall & Bradley have one in constant operation at Shermantown, and another at the same place is owned by Meaen & Higgine. Van Wyck, the assayer, has one within the town of Hamilton, and there are two or three others of lesser note in the same place. In addition to all these, there are several blast and draft furnaces located in the cañons, in the immediate vicinity of the base metal mines.

So that you must see that the prospects for the smelting interest and for the mines of base metal in this district are equally good as those of the mills and the mines of "free ore." W. H. M.

Shermantown, Nev., April 6, 1870.

Boiler Explosions.

[Written for the Scientific Press.]

Editors Press:—I was some days since in one of the Courts of this city, and heard the evidence given by some engineers in a boiler explosion case, as to the cause of the same. They attributed such accident to gases generated in the boiler, which takes fire and explodes by contact with the air.

If that statement is true, no one is safe near any steam boiler at any time when there is steam on, as it must be generating that fearfully explosive gas all the time, and would be liable to explode at any moment, even in the most skillful and scientific hands.

Water is composed of two gases, namely: oxygen and hydrogen, neither of them explosive separately, *nor can steam be decomposed or resolved into its constituent gases by superheating, even up to the highest temperature known.*

To effect the decomposition of steam in a boiler, it must be brought to a high temperature, and, at the same time, come in contact with some substance for which one of its constituent gases has a greater affinity than it has for the other constituent, and, whatever that substance may be, having that affinity, it will take up but one of the gases, leaving the other free, and, consequently, non-explosive. Let us suppose, for an instant, that the gases are set free in the boiler, and, also, in combination, (which would be an impossibility); to explode them you would require a high temperature, which could not be attained, unless the water is so low in the boiler as to expose the sheets to the direct action of the fire without the protection of water on their surfaces.

I think the true theory of boiler explosions may be summed up in a few words, as follows:

When the water in the boiler is allowed to get too low, the fire surfaces become exposed to the fire, without the protection of water upon them; the plates instantly become red hot, which superheats all the steam contained in the boiler to a very high temperature, the water being comparatively at rest; then, if the throttles or safety valve is opened, that act relieves the pressure upon the water, which relief imparts to it commotion or foaming, and the instantaneous commingling of the particles of water, in minute subdivision, with the superheated steam, aided also by coming in contact with the red hot sheets, at the same moment converts the entire contents instantly into steam, producing a sudden pressure which no boiler can withstand.

I. L. C.

Australian Gold.—The value of the Australian gold imported into Great Britain in 1869 was $39,463,785, an increase of $4,515,815 over 1868, and of $10,457,550 over 1867. This year commences with a receipt of $3,766,825 for January, a large increase over preceding years. The opening of new gold fields in New Zealand, Queensland and Tasmania has contributed to the increase during the past years. Recent official returns show that 2,651 distinct quartz veins have been proved to be auriferous in Victoria, and at the same date 884 square miles of gold fields were worked, and the value of gold mining claims was estimated at $44,347,520. The gold production of Victoria in 1868 is given as 1,657,498 ounces, of which about one-third was from quartz veins.

* * *

Correction.—In our issue of March 12th, the name of the translator of Prof. Cotta's invaluable book on Ore Deposits should be **Frederick Prime, Jr.**

Mechanical Progress.

A New Double Slide Valve.—A noted Scotch engineer by the name of Barclay has devised a valve, which is thus described by *Engineering:* "Mr. Barclay employs a double or compound valve, the two portions being driven by separate eccentrics. The steam ports in the lower side of the under valve are made large enough to leave the steam ports on the cylinder full open during the entire time that the steam is admitted in full by the ports in the top side of the valve; and the cover or upper valve has one port made at its center in such position that immediately one of its edges begins to cut off the steam from entering one of the larger and outer ports in the under valve the port in the top valve passes over and opens one of the second ports in the upper side of the under valve in the exact ratio that the larger port is being closed, so that although the larger port is being gradually closed, the supply of steam remains constant until the larger port is half closed, at which instant or position both the larger as well as the smaller ports are quickly closed over by the upper valve through the action of the eccentrics by which the valves are driven. From this arrangement it is obvious that, as the steam commences to be cut off only when the larger port is half covered by the upper valve, the cut off is effected with a travel of valve equal to only half the width of the larger port in the under valve, and thus a greater advantage is derived from the expansion of the steam in the cylinder than in cases where the cut off is performed in a longer interval of time."

How to Run a Locomotive.—*The Locomotive Engineer's Monthly* gives a "Letter from an Engineer," a portion of which we quote: "An engine can be run cheaper by keeping the water in the tank warm, and by keeping the boiler high in water. It is a bad practice to run connecting rods slack; it is more liable to break a crank, shaft or pins, and there is more danger of losing keys; it also causes a heavy knock on the top slide bars. Steam should never be put on in starting too quick, as it affects all connections, particularly steam pipes. A train should never be stopped by reversing and putting on steam, except in case of danger to life or property. The larger engines are built, the better. I believe in a short stroke pump in a cold climate, as there is less danger of its breaking. It is a good idea to have valves in tenders; there is less danger of bursting hose bags. I have often seen safety valves stuck by dirty water forming cement. Cylinders are often cut by running an engine over, not for want of oil or tallow. When an engine is running without steam, valves should be let run to the full extreme; it prevents the face from wearing hollow. Every engine ought to be reversed after getting oil or tallow; an engine bearing a heavy pressure of steam on one occasion is not sufficient proof of its always being capable of doing so."

Expiration of Bessemer's First Patents.—The result of this will not be the throwing open the process to the public, for Wm. Kelly, an American, controls the business by his patent, which does not expire until 1871, and may be extended for seven years longer. The *Artisan* says: "After Mr. Bessemer had secured his patents in Europe and in this country for the leading feature of the process, which is the blowing of air into and among a mass of molten iron, it appeared that about the same time or prior to its invention in England by Mr. Bessemer, the same thing had been invented in the United States by Mr. Kelly, who, after the issue of the patent here to Mr. Bessemer, also made application for a patent, which, on proving priority of invention, he obtained."

The Harvey Torpedo.—This is a wooden casing with iron plating outside, and a metal shell inside, to hold the charge. It is so shaped that when towed rapidly it will diverge from the towing vessel at an angle of 45°. The explosion is effected at will, by means of a lever attached, when the torpedo is in close contact with the bottom of the enemy's vessel. The explosive agent is a fulminate composed of three parts by weight of chlorate of potassa and one of gall-nuts. A safety key, which secures the operators themselves from all possible danger, is withdrawn when the torpedo is some distance astern of their own vessel.

A Millionth of an Inch.

A space of this length, which is almost inconceivable, so minute is it, is actually *measured* by Mr. Whitworth's contrivance for comparing lengths, designed for testing the truth of a measure representing an English inch, and described by Dr. Barnard in his Exposition report. It is a solid piece of steel resting upon a trough with inclined sides. At one end it abuts against a stop, which is so arranged as to be adjustable. The other end is opposed to the extremity of a screw of twenty threads to the inch, placed directly in the line of the axis. A single revolution of the screw advances the extremity, therefore, one-twentieth of an inch. But the head of the screw is ten inches in circumference, and is divided into two hundred parts. In turning this wheel, every division accordingly advances the screw one four-thousandth part of an inch. The divisions, however, are not traces, but teeth; and the screw-head is a gear-wheel, which is driven by a tangent screw lying horizontally in its plane and across its summit. And this tangent screw has also a head of twelve and a half inches in circumference, which is divided into two hundred and fifty parts, each part being the twentieth of an inch. An entire revolution of the tangent screw advances the gear-wheel only one tooth, which, as we have seen, moves forward the end of the measuring screw one four-thousandth of an inch. A single division of the limb of the tangent screw-head will, therefore, produce a movement in the direction of measurement of only two-hundred-and-fiftieth of one four-thousandth of an inch—that is to say, of one one-millionth part of an inch.

English and American Engine-Makers.—"An English workman in America" writes thus to *Engineering:* "The American manufacturer has several advantages over European, the principal one being that he is left to his own judgment in the designing of his engine. For example, a railway wants a dozen engines; in England the superintendent of the road designs and orders exactly what he thinks best, and the manufacturer has nothing to do but to make them; if they don't work well there is at once a dispute as to whether the fault lies in design or in workmanship. In America, the railways frequently order their engines of a certain manufacturer, he designing and making them; he, then, is solely responsible; it is to his interest to turn out an engine that will make him a reputation. His experience, of course, must be large, and hence he has better opportunities of seeing defects and advantages in design and construction, than any superintendent of a railroad can have. The specifications for some locomotives I have seen in England occupy 40 pages of foolscap; the specifications here usually about three or four. There is no quibbling as to whether the specification called for this or that. This is another reason for the excellency of American engines; if any maker produces something new and desirable, the others are compelled either to adopt it or effect the same advantage by analogous means."

Rapid Telegraphing.—The new telegraph company, the "National," which is now erecting wires between New York and Washington, and will do so all over the United States, expects to transmit dispatches at the rate of 12,000 to 18,000 words per hour over a circuit of 1,000 miles. They affirm that they have already demonstrated, by actual experiment, that they can work perfectly over 2,000 miles of line at the rate of 200 words per minute with 28 cups of battery, whereas no Morse machine is able to work through even 500 miles at the rate of five words per minute, with 50 cups of battery. The instrument used is the recently patented one of George Little. The messages to be sent are prepared by punching slots and circles through a strip of paper, which, on being drawn through the instrument, transmit corresponding signals. These are received and made visible upon strips of chemically-prepared paper. Copies of messages may be dropped at all stations upon the line without interfering with the working of the instruments.

Warming Railway Carriages.—A. Mr. Buchan has invented in Russia a method of warming railway carriages by utilizing the heat of the locomotive.

Scientific Progress.

The Primeval Monuments of Peru.

E. G. Squier, M. A., the well known antiquarian, describes and illustrates in the *American Naturalist* for March certain stone structures in Peru, the existence of which has never before been mentioned by any traveler. They are "coincident in style and character with the cromlechs, dolmens, and 'Sun,' or 'Druidical' circles, so called, of Scandinavia, the British Islands, France, and North and Central Asia." We give the concluding paragraph:

"When they shall come to be fully illustrated, I think all students will coincide with me in my already matured opinion that there exist in Peru and Bolivia, high up among the snowy Andes, the oldest forms of monuments, sepulchral and otherwise, known to mankind; exact counterparts in character of those of the 'old world,' having a common design, illustrating similar conceptions, and all of them the work of the same peoples found in occupation of the country at the time of the Conquest, and whose later monuments are mainly, if not wholly, the developed forms of those raised by their ancestors, and which seem to have been the spontaneous productions of the primitive man in all parts of the world, and not necessarily nor even probably derivative."

The Brain only a Machine.—The following is from a discourse recently read by the celebrated physicist, M. Mayer, before the Scientific Reunion of Insbruck. It was translated for the *Bowdoin Scientific Review:*

"For a long time we have generally supposed that the nervous substance, and especially the brain matter, contained free phosphorus, and the imagination attributed to this *free phosphorus* an important part in intellectual operations. But new and more exact researches in chemistry have proved that no living organ, and of course the brain, contains free phosphorus. If, on one side, similar illusions must vanish before the data of an exact science, it is none the less true, nevertheless, that there are continually produced in the living brain, material modifications, which are, as it were, the consequences of a sort of molecular activity, and that the intellectual acts of the individual are intimately connected with this material cerebral action. But it is a great error to identify these two activities which proceed parallel to each other. An illustration will render my thought clearer. We know that there can be no telegraphic communication without a concomitant chemical action. But what the telegraph says, the contents of the dispatch, could never be regarded as a function of the electro-chemical action. That is still truer for the brain and thought. The brain is only the machine, it is not thought. Intelligence, which is not a part of sensible things, cannot be submitted to the investigations of the physicist and the anatomist."

Insect Organs of Hearing and Smell. Mr. Lowne believes that the organ of smell in the flesh fly is located in the third joint of the antennæ, which are dilated, and covered with minute openings communicating with sacs in the interior. The halteres—the appendages just behind the wings on each side—he regards as the organ of hearing, their cavity being filled by a very large nerve terminating in nerve cells, which is connected with a number of small, highly refracting bodies, regularly arranged around the base of the organ.

Geology of Brazil.—Prof. C. F. Hartt, of Cornell University, proposes to make a third trip to Brazil during the summer. Several students will accompany him. He proposes to study especially the Amazonian drift. Doubts have been expressed by several geologists in regard to Prof. Agassiz's theory of a great Amazonian glacier.

Large Trees in Australia.—The Government Director of the Botanic Garden at Melbourne says that Mr. G. Klein took the measurement of a *Eucalyptus* on the Black Spur, which was 480 feet high; and adds that to Australian trees must be conceded the palm for height, though not for thickness, over the *Sequoia* of California.

The Markings Produced by Lightning.

Dr. B. W. Richardson has been making some experiments with the monster induction coil of the Royal Institution. He is satisfied that the markings produced are not always ecchymoses, as he had previously maintained, but may be true metallic lines, when the metal on the body is thin enough to be fused by the current. Several lecture experiments were performed in proof of this. We quote:

"We will take a foot which has been removed from a young pig immediately after the animal was killed and dressed. The skin is beautifully white and delicate. Around the foot we will lay a thin gold wire or chain, and then discharge from the large Leyden battery through the wire. This done, I pass you round the foot, and you will see distinctly, not only a line marking what was the position of the wire, but the metallic gold, inlaid as it were in the skin. * * Here is a feather of exquisite whiteness; I have woven through it some thread of gold; here is another similar feather through which I have woven thread of silver. I will ask Mr. Pepper to pass the Leyden discharge through these metals interwoven with the plumage. He does so, and now you see the feathers are entirely changed in color, variegated in wavy lines. The feather interwoven with gold is of a purple tint in the colored parts; the feather interwoven with silver is of silver gray, like the feather of a gray parrot, and so firmly is the metal implanted it could not readily be removed except by chemical action, which would break up the structure."

The Geology of the Rocky Mountains. Dr. F. V. Hayden, of the U. S. Geological Survey of Colorado, says: "My own observations point to the conclusion that the general strike of the metamorphic ranges of mountains is northwest and southeast, and that the eruptive trend northeast and southwest. The dikes that sometimes extend long distances across the plains, in all cases trend northeast and southwest, or occasionally east and west. The purely eruptive ranges of the northern portion of the San Luis Valley seemed to be composed of a series of minor ranges "*en echelon*" with a trend northeast and southwest. But as soon as this range joins on to a range with a metamorphic or granitic nucleus, the trend changes around to northwest and southeast. Many of the ranges have a nucleus of metamorphic rocks though the central and highest portions may be composed of eruptive peaks and ridges. In this case the igneous material is thrust up in lines of the same direction as the trend. It becomes, therefore, evident that all the operations of the eruptive forces were an event subsequent to the elevation of the metamorphic nucleus."

The Electric Light in Rarified Air. Poggendorff's *Annalen* describes the following experiment: "Two very thin platinum wires, whose points were placed opposite to one another, at a distance of one millimetre, were brought on to the plate of an air pump, and formed the poles of an inductorium. At the same time, the wire which corresponded to the negative pole was twisted round the bulb of a thermometer. It was then found that under full pressure of air the point of the negative wire glowed with a clear light, and behind was a train of a beautiful blue color; the height of the thermometer remaining unchanged. As the air was pumped out the point ceased to glow, while the blue light moved to a greater distance from the point, and towards the thermometer, which rose about 20 degrees Cent. (36 degrees Fah.) With more complete exhaustion of the air the blue light moved further in the same direction, and left the thermometer, which again sank, and all the parts to which the wire was attached shone forth in the beautiful blue light, while the point of the wire itself was almost devoid of light."

Preparation of Chlorate of Baryta. Brandau proposes the following method: Forty-nine parts by weight of sulphuric acid, 333 parts of sulphate of alumina, 122½ parts chlorate of potash are mixed to a thin paste in water and gently warmed. The product is a solution of chloric acid with alum, and excess of sulphuric acid and sulphate of alumina. When cold it is mixed with an equal volume of alcohol and filtered. The filtrate is neutralized with caustic baryta, which gives chlorate of baryta in solution, while sulphate of baryta is precipitated. The chlorate is decanted from the precipitate and evaporated to expel the excess of alcohol and is then ready for use.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

More Force.—*Chronicle*, April 2d: Next week an additional force will be put in the Pennsylvania mine. A few tons of ore have been sacked for shipment to the Stetefeldt furnace at Reno. The mine is daily improving.

Good Hope.—*Miner*, 2d: We hear of a bet that the first lot of twenty-five tons, now being taken out to be worked at the Pioneer mill, will yield an average of $50 a ton. If it yields $20 it will prove a fortune to its owners.

AMADOR COUNTY.

The New Ditch.—*Dispatch*, 9th: Work on the new extension of the Butte ditch has been commenced in earnest.

Good Clean-up. —*Ledger*, 9th: The Kennedy mill, after a run of fourteen days, cleaned up $3,400. The company having been regularly incorporated, it will now be worked more systematically.

CALAVERAS COUNTY.

Railroad Flat.—*Chronicle*, 9th: We are informed that Messrs. Cudell, Sanderson & Gay are taking out rock of unequaled richness. They have a large amount of ore on their dump which will be hauled to mill and crushed as soon as the roads will permit.

EL DORADO COUNTY.

Busy.—Placerville *Democrat*, 9th: Hardly an idle man can be found in our city. Those who have not steady business are prospecting, and quite a number have found ledges which bid fair to turn out rich. We have the mines here, and all that is needed is energy.

Phillip's Diggings.—This is the name of some new mines eight miles from Grizzly Flat, and one and a half miles from Pi Pi. They have struck a rich gravel deposit, and several companies have secured claims. The great trouble is the lack of water.

Gold Dust.—There has been shipped by Wells, Fargo & Co., during the past week, $8,090.

INYO COUNTY.

Los Angeles telegram, 5th: One hundred and fifty-seven bars of Cerro Gordo bullion are received—over two thousand at the mines awaiting shipment.

KERN COUNTY:

Telegram—Los Angeles, 5th: In Kern county, the Long Tom, and the mine in Snowy district, are the only mines now worked, both on the east side of the range. The mills in the vicinity of Havilah are idle.

LOS ANGELES COUNTY.

Placer Mining.—*News*, March 26th: At San Gabriel cañon miners are making handsome pay at work in the bed of the river. With rockers some are reported as making three to five dollars per day.

MARIPOSA COUNTY.

Suspended.—The Oaks & Reese Mining Co., Hunter's Valley, has suspended operations entirely. All the hands in the mine and mill have been discharged, and the tools, car tracks, etc., hoisted out of the mines. The vein giving out is the cause.

NEVADA COUNTY.

A Strike.—*Transcript*, April 5th: Several weeks ago, Fritz Weister and Sam Morrison struck very rich gravel on the north fork of Diamond creek, above Cal. Curtley's claims. They have located three claims and a water right, and will be ready for work next spring. On the claim they sunk a prospect shaft 12 feet deep and found gravel from the surface down. The dirt yielded $26 in gold.

The Prospects.—Same of 6th: Last season the total rain-fall was 59:69 inches. This season, the total has been 49:06 inches. Thus far the season has been more favorable for mining purposes. The snows are not so deep in the mountains as last year. While this scarcity of snow may lessen the supply of the water west of the Yuba, it will give miners on the Ridge an earlier opportunity to get a supply, as the North Bloomfield Co. will the sooner be able to resume work, and complete the connection between the new ditch and the Big Cañon creek. All things considered, the hydraulic miners throughout the county have an excellent prospect.

San Juan.—Cor. of same, 7th: There are now four companies mining on this Hill, where in 1866 there was but one. Fifteen hundred inches of water are constantly in use. Our banks embrace a range of country from French Corral to Columbia Hill, a distance of 15 miles, of which range San Juan is the central point. There is a tract of mining land, extending from Sweetland to Sebastopol, over a mile in length and three-fourths of a mile in width, every rod of which will pay, as yet, almost untouched.

Red Diamond.—Same of 8th: This claim at the Cascades, Deer creek, has been doing well. The last run gave a return of $1,400, and lately $300 was taken out in two days.

The sale, to an English company, of the Buckeye Hill and Granite Tunnel mining claims, near Sweetland, is about being perfected.

Stiles.—Same of 10th: The new hoisting and pumping machinery is kept in constant operation. The shaft is down 25 feet, and it is proposed to sink 200 feet below the level of the creek. The ledge is 18 inches thick, and the rock has paid from $10 to $25 per ton.

Gold Flat.—The north extension of the Pittsburg, owned by a company in San Francisco, is to have machinery put upon it for prospecting, this summer, and the Orleans Co. propose putting up hoisting and pumping machinery at an early day.

Alta California Mining Claims.—Grass Valley *Union*, 6th: These are on Randolph ridge, south from Webster & Co. A tunnel has been run in 850 feet and gravel struck which prospects from one to four bits a pan. The deposit is extensive. The company are putting in a flume, and in three weeks will commence washing.

Allison Ranch.—Mr. Davis, Supt., informs us that the new level has been driven 25 feet each way from the shaft, and to-morrow he will start his workmen to stoping out the backs. The incline has been sunk 12 feet below the new level, and will be continued down 100 feet, at which point another level will be started. The rock taken out of the incline in sinking the last 100 feet, yielding $36 per ton, exclusive of sulphurets.

Greenhorn Mine.—*National Gazette*, 4th: The company still continue to take out rich rock. The main tunnel is in 300 feet, and drifts have been run north and south 200 feet. The ledge is well defined, varying in thickness from five to eight feet. Only eight men are at work, but they take out rock enough to keep an eight-stamp mill running day and night.

PLACER COUNTY.

St. Patrick.—Auburn *Herald*, 9th: We learn that the owner of this mine, near Ophir, is opening out a ledge three feet thick. It is said that exceedingly rich quartz in large quantities is being brought to the surface, and that the ledge becomes more massive and well defined as they go down on it. No quartz from this claim has ever milled less than $300 to the ton.

Mill Removed.—The owners of the Evening Star mine on Rock creek, a few miles north of town,—Taylor, Quick, Heenan & Co.,—have purchased the Wehdall quartz mine at Newtown, and are having it erected on their claim. All crushings from the Evening Star have shown it to be very rich. The last, of some 28 tons, at the Green Emigrant mill, yielded $220 per ton in free gold. At present, everything betokens a prosperous season among quartz miners in this section.

Rising Sun.—The owners of this mine, near Colfax, contemplate erecting a forty-stamp mill, and will have 150 to 300 men at work within two months.

SAN BERNARDINO COUNTY.

Rich Ore.—*Guardian*, April 2d: Mr. John Baldwin has shown us some very rich silver ore, discovered on his place near Juape.

Los Angeles telegram, 5th: The Holcomb valley mines at San Bernardino are producing unusually well. New works are being erected.

Another, 7th: A man named Flynn arrived to-day with tin and silver ore from a point 35 miles from San Bernadino, Specimens have been sent to San Francisco for assay. Flynn says the ledge is not less than 25 feet in width.

SAN DIEGO COUNTY.

A Los Angeles telegram of 7th says: Men direct from San Diego and the mines to-day report that some new ledges have been found in Julian district. It is said that the Washington, Good Hope and Hayden show better on sinking, and present more the appearance of being perfect ledges.

SISKIYOU COUNTY.

Quartz in Scott Valley.—Yreka *Union*, March 8th: We have been shown a piece of float rock from a vein recently discovered in Hull gulch, near Oro Fino, by Frain and Dover, eighty rods above the mill of the Scott Valley Co. It is owned by the discoverers, in connection with Sheppard, Bean and King. The vein is a foot in diameter, and the rock spangled with free gold. Sheppard is running on good rock from the old ledge and expects a clean-up in a few days.

SIERRA COUNTY.

Mining Items.—Cor. of *Messenger*, 9th: The Monumental Co. in Potosi, it is said, is rolling the yellow stuff out of their claims as fast as their mules are able to travel, drawing from seven to nine car loads of dirt every trip. The Hawkeye Co., in Howland Flat, is working 30 men, and washing out every week from 80 to 100 ounces, and the Union is working 80 men and taking out 200 ounces per week. The Down-East Co. is about working out their claims, while the Union and Hawkeye have enough rich ground prospected to last them for years. The French Co., Pine Grove, are extending their tunnel further toward the summit to try another gravel deposit. Sam Noyes & Co. are finishing the lowering of their cut. There are two other companies getting ready for piping. Bill Morgan expects to take out $25,000 this year. He has ground enough for his lifetime.

TRINITY COUNTY.

Paying Well.—*Journal*, 9th: The new mines discovered by Harthan & Smith, near Junction City, are yielding an ounce per day to the hand with a rocker.

Oregon Gulch.—Slattery Bros. have found another channel of the gulch running under the base of the mountain, that is likely to prove rich.

Northfork.—We learn that McGillivray is going to bring the old Durkee ditch to the diggings on the west side of Northfork.

Douglas City.—Cor. of same: The claims in the vicinity bid fair to pay better than for years. Butts & Hunter are getting good prospects. Marsh & Ham are getting good pay. The Union Hill claim, worked by Marshall, Reed & Co., is keeping up its old reputation. The claims of Theodore & Crickard, on Mabie's bench, Ramsey & Mathewson, on Weaver creek, the Portuguese companies, on Smith's flat and Mud bar, Matsen & Co., on Smith's flat, Jones & Hughes, on Trinity bench, Charley Tourat, on the hill near town, also his claims on Filibuster flat, and Silander & Alexander, on the same flat, all promise to pay beautifully. The Whetstone bar boys are doing better than for years.

The Dutton creek mines are assuming greater importance every day. In the discovery claims, Dixon & Co. have drifted through the cement and found soft blue gravel that yields better prospects than ever. Wm. Lange is bringing the water of Dutton creek on the Dixon claim. It will take a month.

TUOLUMNE COUNTY.

Confidence Mine.—Sonora *Democrat*, 9th: Six days' run last week produced 400 ounces of about $7,500 value.

A correspondent of same has visited the Confidence mine, and gives these items: Depth of lowest level, 160 feet; length of incline, 296; width of south vein, 10 to 14 feet, and pays from $8 to $15 per ton; width of north vein, 7½ feet, paying from $30 to $150 per ton. Engine at hoisting works is of 35-horse power, and, with pump and pipe, cost $4,500; the pump has six feet stroke, and there is 300 feet of five-inch pipe. The engine for the mill is of 60-horse power, and cost $3,500. The capacity of the mill is from 30 to 40 tons per day, averaging $700 to $800. Fifty men are employed at wages from $2 to $3 per day and board.

Arizona.

Big Bug.—Prescott *Miner*, March 26th: The Indian raid retarded mining matters for a few days, but the mill is now crushing. A clean-up had been made, after a run of six and one-half days, with ten stamps, and the yield was estimated at $1,400.

Walker District.—Lynx creek and its tributaries are filled with water, and the miners at work. The Eureka 10-stamp mill was started up several days ago. Uncle Billy Pointer's arastra is crushing rich ore; C. Y. Shelton is arastraing ore from the Mountain Jay; Herbert Bowers and Co. have men running a tunnel towards the Accidental lode. Lower down six or eight men are at work in the hydraulic claims belonging to Bowers, Bean and Lieut. Wells. The claims of the Bashford Co., near the old Mexican camp, are being turned upside down by six or eight men and a big head of water; as are, also, the hydraulic claims of Jackson, Lovejoy & Co.

Hassayampa.—A great many placer miners are at work in the district. George Lount, Frank and Lew. Alters are running a tom in a side gulch, and making from $10 to $20 per day to the hand. Most of the miners are at work in the high bars of the main creek. C. V. Beseler, Supt. of the Sterling, intended to start the mill, provided there was sufficient water to run it. Taylor & Davis were getting ready to start their arastras.

A prospecting party returned from Turkey Creek district several days ago, and brought very rich specimens of silver ore.

Colorado.

Rich Strike.—Georgetown *Miner*, March 31: Very rich ore has been struck in the North American lode. We were shown a specimen from the bottom of the shaft, 50 feet deep, that was rich in brittle silver. The crevice is over 8 feet wide, and, in addition to a large vein of good mineral, there is nearly three inches of ore assaying, probably, $450 to the ton.

Mendota.—Work will shortly be commenced on this lode. The Rockford Co., of Rockford, Ill., have become the owners of the east half of the property. There is a tunnel on the vein 130 feet in length, in the breast of which there is a vein of ore two feet in thickness, with an average of fifteen inches, and assaying from 60 to 800 ounces to the ton of ore. The company will open the mine by a tunnel 150 feet in length, which shall penetrate the lode at nearly a depth of 150 feet

Work is being pushed vigorously on the new Stewart reduction works. The mill, when completed, will have a capacity of twenty tons per day.

Sale of the Terrible.—One-half of the Terrible, the largest and richest silver vein in Colorado, has been purchased by a company of English mining capitalists. Mr. Henry Crow, formerly part owner of the recently purchased interest, is in receipt of a telegram from his partner, Fred A. Clark, now absent in England. An agent will be sent immediately to take charge of the mine. At this time the Terrible is producing ore such as will make glad the hearts of the foreign capitalists.

Latest.—A Georgetown telegram of April 11th says: The sale of the Terrible silver lode was completed to-day, through the British and Colorado Mining Bureau of London, to a stock company of London capitalists for $550,000. The agent of the new company, under the style of the "Colorado Terrible Lode Mining Co.," took possession to-day. The mine will be vigorously worked hereafter, with an increased force of men; first-class ores will be shipped to England for reduction, and for the treatment of the second and third-class ores they propose erecting pressing and smelting works on a mammoth scale in this vicinity.

Idaho.

Getting Ready.—*Avalanche*, April 2d: Owners of placer claims are making preparations. Jacob's gulch boys are laying in grub and hauling it over the mountain on hand-sleds. Shuster & Co., in Blue gulch, are sawing locks for their flume. Work has already started at the Wagontown diggings. Slaughter House gulch ditch is being cleaned out and sluice boxes repaired. The bars this side of Wagontown will be worked this season by Chinese. Some of the owners of claims on Florida mountain are shoveling snow and arranging flumes.

The *Statesman* of 2d says: The injunction suit, in which the Idaho and Rocky Bar companies were parties, has been vacated, and work will be resumed on both mines.

Loon Creek.—*World*, March 31: Tassel, expressman, arrived safe from Oro Grande on the 23d. There are not over four or five inches of snow, and the several companies had begun work. Three miles of the bar, on the town side, has proved good as far as prospected, the depth to the bed-rock varying from 10 to 40 feet. The bar claims are principally drift diggings. John Ramey and party had struck good diggings thirty miles below town, on a creek between Loon creek and the right hand bank of Salmon. The camp will support a thousand people this season, and claim owners are afraid that the supply of labor will not be sufficient. Tassell says, also, that Stanley Basin will afford employment to 80 men; Deadwood, 25; Robeson's bar, 60, and Loon creek from 400 to 500. Wages, he thinks, will be $6 per day.

Oregon.

The Roseburg *Plaindealer* says: New mines have been discovered on a branch of the East Fork of the North Umpqua river, called Fall creek. The miners are said to be making from four to ten dollars a day.

Willow Creek.—The La Grande *Democrat* is informed that there will be no water brought into camp by the Burnt river ditch before the 18th of April. Where the ditch strikes Camp creek, the snow is 8 feet deep. The miners have their sluice boxes and hydraulics ready.

Nevada.

HUMBOLDT.

Mining Items. — *Register*, April 9th: Webh's mill at Gold Rnn will start up the first of next week....Efforts arn being made to have work resumed on the Pride. Buck & Kuakel have a lease of the mine till August ...Trask & Co. have struck a body of rich copper nre, after sinking 90 feet withont a trsce....L. C. Pease has 40 tons nf ore from the Stars and Stripes, sacked and piled at the depot, ready for shipment. The mine yields five tons of first-class ore per day....Henderson & Co. are sacking fine ore from tho Neptune.... Burton has gone to San Francisco to purchaso a smelting furuace....Four car loads of ore shipped this week from Battle Mountain....The Toledo company will commence in a few days....Tho Star City Co., at Golconda, have arranged mattors with their creditors, and will resume operations immediately.

Galena.—Cor. of samc: The White minc, supposed first north extension of the Shiloh, has been leased until the first of June hy S. R. Knowles. In the now shaft a large hody of ore has been struck, assaying two hundred dollars per tou. About fifteen tons have heen shipped during the week, and the supply appears inexhaustible. It is prohable that the mine will change hands, as the stipulation, $5,000, is a small snm, if the ore holds out. The returns trom the last shipment from the Shiloh were $80 per ton. H. L. Spargur, lessee, is prosecnting work with vignr. The new ehaft; wbich is to he 100 feet deep, is now down 30.

REESE RIVER.

Shutting Down.—*Reveille*, 9th: Manhattan mill closes to-day fnr the purpose nf introducing the new roasting process. The erection of the furnace will probably occupy a month; after which the mill will do more work than heretofore. The season is now propitious, the mines never looked better, and when the mill starts up, it will do so with hrighter prospects than ever.

Cortez.—We learn from S. O. Clifford, who arrived on Saturday, that matters have heen quiet, owing to the etoppage of the oaly mill in the district. A few companies have been taking out small lots of chloride ore, and are waiting for tho mill to start, which will bo some time in May.

Mineral Hill.—The Grass Valley *Union* has a letter from Uncle Billy Chollar to G. C. King, from which we quote: "The specimene marked 'Giant' is from a shaft 50 feet deep and the ledge is seven feet thick, and we think it will pay $500 per ton. My tunnel will strike this ledge 300 feet deep; and the tunnel will strike two or three other ledges in 400 feet from the mouth. * * I dnn't go on a large company any more. Two of ns can hold 600 feet and that is large enough. Two day'e work will hold a claim for one year. Now if you will come here we will make a few locations and hold on. * * Now, this is the richest camp in mineral I wae ever in, and I am going to fight it out on this line."

WASHOE.

Imperial : Empire.—Gold Hill *News*, April 9th: Sinking in the main shaft is resumed, and a station will be opened for the new level, to drift west through tbe ledge.

Yellow Jacket.—The new body of rich ore at the 900-foot level proves more extensive than supposed, It is kuown to be 18 feet wide, and has beeu breasted out for 25 foet north. The daily yield of the mine is 350 tons.

Hale & Norcross.—Shaft 100 feet deep helow the sixth level, and further sinking ceased. A station is being opened 85 feet bolow the sixth, leaving 15 feet for a sump. This new eeventh level will be in orn from the start.

Sacramento & Meredith. — Actively worked at the surface. The dump and ore house is completed, and the double track for sending ore in cars down to the mill is now being laid. The new mill is progressing, the building being nearly completed, and tbe machinery all on the grnund. It will be running in a montb.

Gouln & Curry.—Daily yield 85 tons, frnm the npper levels; average assays $73 per ton. The ore of the El Dorado section still improves. The bullion yield for March footed up $50,213.15.

Ophir.—The water in the new shaft is reduced to the lowest station—lnwer than at aay time since the 700-foot level cut the east clay of tbe ledge. The new steam hoistiug works operate well.

Daney.—A track is laid from the dump to tbe shaft, and measuree are being taken towards the extraction of the good surface ore.

Occidental.—During the week, crosscutting iu the lower tnnnel shows the ledge to he at least nine feet wide. The ore assays from $30 to $270 per ton.

Chollar-Potosi.—The drift at the 500-foot level west of the new sbaft has quartz and porphyry. Total receipts for March, $113,188.65.

Belcher.—Considerahle water in the 730-foot level, hut prospects for gond orc excellent. The upper levels yield 70 tons of average grade nro daily.

Crown Point.—Yielding 40 tons of low grade ore daily from tho upper levels. The receipts fnr March fnoted up $22,000.

Sierra Nevada.—Mill running steadily and yielding well, the supply being from the east body of the surface deposit.

Calenonia.—The drift from tho shaft at the 200-foot level has reached the ledge, and a good yield is beginning.

Savage.—Bullion receipts for March, $23,000.

Let Out.—*Enterprise*, 6th: Tho miners of the Imperial & Empire mine werc let out last eveuing. Thcy had been confined therein since six o'clock on Friday evening. No very encouraging devolopment, we learn, were made during tho time they were shut dowa.

Sutro Tunnel.—This is in 927 feet. The ground is quite hard. No water is heing encountered at the face of the tunnel. The superintendent will try a new explosive noxt week called Hercnles powder. Heretofore ho hae nsed none hut common black blasting powder.

WHITE PINE.

Review.—*News*: The spring is opening finely, and the universal testimony nf miaers is, that a few more days of good weather will enable them to take out and transport to the mills enough ore to keep every stamp in the district gning day and night. Many of our best average mines bavn large quantities of ore on their dumps, wbich will be shipped to the mills as soon as the roads will admit. The water works were, nn the 4th inst., knocked down hy the Sheriff to W. G. Bourno, of San Francisco, for $43,000. At no time, the past winter, ought tbe works to have failed to pay a large interest on that amount. We look to an early resumption of the business of the late company. Most nf the hase bullion goes east to New York. Shippers find that they tbereby make from $48 to $70 more per ton.

Items.—*News*: The contractors on the Morrison & Shipton mine have struck gray carbonate ore in abundance....The Clark & Cross mine, on the Base Metal Range, has also struck fine ore....The Alsop smelting wnrks are turning out rich bullion. The White Pine worke, damaged by the late storm, are nearly roady to start up. A mine belonging to this company, on the eastern slope of White Pine mountain, is turning out exceedingly rich ore....The fissure in the Noonday mine is turning ont a big thing. Where the main east drift cut the ledge the ore averages $180 to the ton, hy assay, and by mill process works 73 per cent. The quality has steadily improved, and the ore now being cnt by the lower drifts is very rich....The Westford mine has been bonded to W. N. Osborne, who will push work on a large scale.... The company owning the "Jennie A." have got their mine splendidly opened, and bave 100 tons of good ore now on dumps. Gen. Biggs, the only memher of the company who has means, has kept the rest in eupplies through the wiuter, and they are now taking out $100 ore.

Items.—*Empire:* The Tom Paine mine bas bcen sold to a Chicago company, and wo may look for active operations in a sbort time. We are advised of other extensive negotiations....Wo understand that tbe Stanfnrd mill will resume operations on the 11th.

Original Hidden Treasure. — *News:* This mine, the first located on Treasure Hill, has tn-day more ore of good quality than any, save, perhaps, the Aurora South. The lower tunnel is in 200 feet, and has 90 feet to go hefore tapping the shaft. The tunnel hae cut into nre of excellent quality more than 20 feet. The nortbwest incliue frnm the south cut opens into a large cbamber, wbich is tapped by a sbaft, covered witb an orehouse. The body of ore in this part nf the mine is first quality—some of it exceedingly rich in hnrn silver—aud it is appareutly abont 40 feet wide, hut will not, perhaps average over 25. This body is pitchiug southwest, into the hill, the whole of it bigh grade, and along the faoe nf one breast a knife may be stuck into the ore in many places, while thin sheets of it cau be donbled like a piece of paper. Minere eay that there are large qnantitiee of ore in this chamber which will pay $2,000 to the ton.

San Francisco Mining Stock Market.

The mining share market has bceu characterized hy greater activity than during tho previous week, the majority of stocks showing a recession from opening prices of the present week.

The aggregate assessments aud dividends of the claims located on the Comstock lode for the first three months of the past five years have heen as followa:

First quarter, 1870	Assessments	$731,000
First quarter, 1870	Dividends	220,000
First quarter, 1869	Assessments	156,200
First quarter, 1869	Dividends	588,000
First quarter, 1868	Assessments	557,900
First quarter, 1868	Dividends	310,000
First quarter, 1867	Assessments	230,780
First quarter, 1867	Dividends	790,000
First quarter, 1866	Assessments	474,600
First quarter, 1866	Dividends	90,000

We call the attention of the reader to the anuexed table, the same being a mouthly statement of tweuty-two mining companies for the months of January, February, and March, 1870, giving their highest aud lowest price, bullion product, assessments, and dividends, as near as could bo ascertained, as well as the aggregates for same time in 1869, 1868, and 1867. As usual, we havo been ohliged to estimate the hullion product of the Yellow Jacket Company:

Company.	January.					February.					March.				
	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.
Belcher	$16 75	$14 75	$34,106			$19 00	$15 75				$34 50	$16 25	$65,368		
Bullion						7 00	4 00		$10,000						
Caledonia			2,078					$4,442					7,276

Lady Bryan	6 50	2 50				4 00	1 00				7 00	2 75		12,000	
Ophir	15 00	12 50		33,600		15 37	10 50				25 00	11 37		50,400	
Overman	76 00	60 00	49,229			69 00	63 00	57,613			110 00	63 50	72,000		
Savage	47 50	37 75	25,560			41 00	30 50	7,035	160,000		60 00	29 50	23,030		
Segregated Belcher	8 00	6 25				7 00	5 25				8 87	5 50		12,800	
Sierra Nevada	9 87	7 25	11,025			8 00	6 50	12,300			9 25	6 37	15,600		
Yellow Jacket	56 00	44 00	125,000			54 50	42 00	125,000			53 00	41 06	125,000	168,000	
Total in 1870			$603,843	$230,800	$ 48,000			$520,546	$218,000	$ 96,000			$644,976	$285,200	$ 76,000
Total in 1869			673,500	16,000	224,000			600,513		160,000			766,872	140,200	204,000
Total in 1868			481,016	294,900	110,000			501,333	186,000	110,000			781,697	76,000	90,000
Total in 1867			1,022,377	110,300	294,000			1,014,238	76,000	276,000			728,916	44,480	280,000

We herewith present a condensed tabular statement relative to the product of bullion, dividends and assessmeuts of the various mines on the Comstock Lode during the first three months of 1870, together with the aggregates of the same period during the four preceding years:

Company.	Bullion Product.	Dividends.	Assessments.
Belcher	$99,474		
Bullion			$10,000
Caledonia	13,796		
Chollar-Potosi	319,997	$84,000	
Consolidated Virginia			23,200
Crown Point	49,172		90,000
Daney			8,000
Empire Mill & Mining Co.			12,000
Gold Hill Q. M. & M. Co.	3,802		
Gould & Curry	101,841		72,000
Hale & Norcross	440,594	96,000	
Imperial			40,000
Julia			6,000
Justice			36,000
Kentuck	92,297	40,000	
Lady Bryan			12,000
Ophir			84,000
Overman	178,842		
Savage	55,625		160,000
Segregated Belcher			12,800
Sierra Nevada	38,925		
Yellow Jacket	375,000		168,000
In 1870	$1,769,365	$220,000	$734,000
In 1869	2,040,885	588,000	156,200
In 1868	1,764,046	310,000	556,900
In 1867	2,765,531	850,600	230,780
In 1866	2,291,883	90,900	474,600

Chollar-Potosi—has been well maintained, under fair sales. During the week ending April 8th, 1,300 tons of ore were extracted, showing an average assay value, from car samples, of $72 10; previous week, 1,217 tons were taken out. Forty-three feet have been added to the drift from the New Shaft, the face of which is now in heavy clay. On the 12th inst., $19,460 in bullion was sent to the office in this city.

Kentuck—was in slight request. During the week closing April 8th, 381 tons of ore were extracted, showing au estimated yield of $5,651, equal to $14 85 per ton. The aggregate bullion product for the month of March was $31,790, and for the quarter, $92,297; same time in 1869 it amounted to $201,088.

Crown Point—increased iu activity, at a recession from opening rates. For the week closing April 8th, 484½ tons of ore were extracted, showiug an approximate value of $5,603 42.

Ophir—has heen lu the market to a very large extent, under an advance. On the 11th inst. the drift had been cleared of water, and at shaft No. 3 "the first-station drift is being well started off."——Sierra Nevada was in moderate request. For the week ending April 7th the ore-product amounted to 390 tons.——Overman declined. For the week ending April 9th, 1,094 tons of ore were extracted.

Gould & Curry—continues to change hands at fluctuating ratea, and at the recent decline. During the week ending April 11th, 675 tons of ore were taken from tho minc. Work has been steadily carried on in the cross-cuts ruuning west at the seventh station. Nine feet have been added to cross-cut No. 2, making the total length 191 feet, the material penetrated being hard, flinty quartz. Cross-cut No. 3 is 78 feet in length, running in heavy clay, mixed with porphyry. Tho upper ore-producing chambera continue to furnish a good supply of ore, and promise well for the futuro.

Hale & Norcrosa—has heen inactive, at a recession in price. During tho week closing April 9th, 1,120½ tons of ore were extracted, against 1,158½ tons the prevlous week. They have on hand, at the dumps, 5,977½ tons, of which 2,485 tous ia low grade.

Amanon (Cal.)—figured conspicuously in the market during the past week, owing to a fire in the minc, which caused the stock to fall as low as $265, closing at over $300 per share. A dispatch of the 14th inst., from the Superintendent, reads as follows: "Sent men down the middlo ahaft last night. No fire in any part of the shaft at the 844-level. They crossed the uorth shaft, and explored the stopes north, and found one log on fire; also, that the platform-timhers had been carried away by the falling of the *debris*. Went down to the San Francisco level; found no fire. The water is tweuty fect above the Panama level. Covered the shafts tight, and shall send down hose to-day to drive all the fire upward—covering the shaft as we come up. No caves have occurred, thus far, and I think the damage is much lighter than at first supposed. No smoke this morning; a little steam and gas is escaping." The bullion yield for March aggregates $56,127.—*Commercial Herald.*

Farming and Gardening.

Communications for this department are solicited from all parts of the Pacific States and Territories.

Adaptation of Crops.

In casting about for the most profitable crops to raise, there are many considerations which the farmer has to take into account, the two most important of which are the nature and condition of the soil, and the nearness or remoteness of a good market. The intelligent farmer will not plant perishable vegetables in a wet, heavy soil, nor will he cultivate such crops largely in a locality remote from a great center of population. The vegetable and fruit-grower locates in the vicinity of a city. The dairyman who wishes to produce butter or cheese, goes back into the country where land is cheap; so with the cattle-grower and the producer of wool. The wheat-grower must also locate near some route of easy and cheap transportation to a market.

One of the greatest mistakes of California farmers is the disposition to crowd the lines of the principal thoroughfares, with the view of paying almost exclusive attention to the production of cereals. To raise a large crop of wheat or barley almost all other productions are ignored. If wheat rules high, when the crop comes off, the plan works well for the time; but if the reverse, disaster and discouragement ensues, a result which always obtains in the long run. How often do we see the wheat-grower, in this State, buying his potatoes and other vegetables, his butter, his cheese, his fruit, his beef, pork, etc., at high prices, with the produce of his wheat marketed at ruinous rates! A large portion of his crop thus goes to pay for that which he might readily have raised upon his own farm, and at very little extra cost—such work may generally be done at odd times, when his principal crop does not demand his attention. Such policy is short-sighted in the extreme.

Farm-work needs to be arranged and carried out in accordance with certain fixed and well-known principles of agricultural science. There is no great difficulty involved in this idea, even here, in California, where many of the practices of the East are inapplicable, except under frequent and greatly modified conditions.

If every part of a farm could be treated each year with a liberal dressing of barn-yard manure, impulse, accident or caprice even, might, with a great degree of impunity, be left to determine the nature of the crop upon any field. We see this fact exemplified in the case of the extensive market gardens, near all our great centers of population, where such dressing is easily attainable. The reason of this is obvious; for the barn-yard and city drainage always returns to the land everything that is taken from it. But in extensive field culture, as in California, such practice is inapplicable, and we must resort to other expedients, such as mineral plant food scientifically supplied and aided by judicious rotation of crops, plowing in green manures and by fallowing. The great fundamental fact which has been abundantly proven, and which must be acknowledged as a necessity for all successful farming, is the rotation of crops. This, however, involves a system of diversified farming, which has not yet been introduced to any extent in this State; but which, as we have often said and again repeat, is peculiarly applicable here. Some hints on diversified farming will be found in another article on this page.

Maple Sugar.—Last year, from a grove of one hundred maple trees in Berkshire, Mass., 500 pounds of sugar were made in five days. Vermont is the largest producer of maple-sugar of all the New England States.

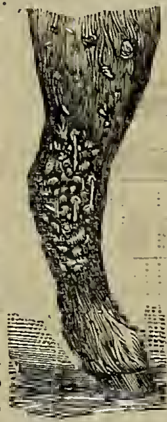
Diseases of Horses.—No. 2.

Glanders and Farcy.

Glanders and farcy are essentially the same disease, or rather two forms or stages of the same. When the disease is located in the nasal cavities it is called "glanders;" when in the lymphatic vessels (those vessels near the surface, which contain the colorless fluid of animal bodies), it is known as "farcy." The pus which flows from either will produce the other. Glanders, however, is generally the first to make its appearance, from the fact that the part of the system where that form of the disease locates is most sensitive.

How and When Communicated.

The disease is readily communicated to the horse or to man, but has never been known to attack any of the brute creation except those belonging to the equine family, as the horse, the ass, the zebra, etc. The fact that it can be communicated to man has only been known since the commencement of the present century. It is always fatal to either man or beast It never makes its appearance in man except by inoculation or transmission from the horse. At a meeting held in Burlington co., N. J., just after the war, to adopt measures to prevent the spread of this disease, which had been communicated by a sale of government horses, statistics were introduced to show that over two hundred human beings had died of the disease. When the disease makes its appearance in man, it takes a modified form, more nearly resembling a malignant fever—never the true "glanders."



Cause and Symptoms of Glanders.

The disease appears to be of comparatively modern origin, and arises spontaneously from exposure to insufficient or unwholesome food, foul air and confinement. It is especially liable to make its appearance when horses are congregated in large numbers, under the above conditions. It was very prevalent about the close of and just after the late war, for the above reasons.

The symptoms attending the first appearance of the disease in the form of glanders, are severe and wandering pains, high fever, great prostration, profuse and offensive perspiration and discharges. Inflammation pervades the face and nasal organs, and the inner pink membrane or middle wall between the nostrils becomes pale and sickly, and covered with small sores, which discharge a viscid, offensive and slightly bloody matter, the same which, generally by contact, imparts the disease to other animals. When these indications make their appearance, fully, the case is hopeless, and the animal should be at once killed and carefully buried, to prevent the spread of the disease. If, however, the animal is allowed to survive this point of the disease, numerous hard pustules appear on the face, and gradually spread over the neck and body. Common gleet is sometimes mistaken for the glanders, though it need never be, with due reference to the symptoms as here described.

Farcy—Its Symptoms and Appearance.

At this stage farcy sets in, and the lymphatic system is attacked. The vessels immediately beneath the skin become hard and cord-like, and sensitive to the touch. These swollen vessels or glands, technically termed "farcy buds," after a while suppurate and form ulcerous sores, which sometimes run together in large masses, as shown in the accompanying illustration. In that condition they exude a pale yellowish and sometimes quite dark-colored matter, very unlike that accompanying healthy granulations on common sores. These swellings and sores usually make their appearance on the sides of the face and neck, but most commonly on the inner side of the legs, but sometimes on the outer side of the body. The entire leg also takes on a swelled and dropsical appearance.

When *farcy* is the first to make its appearance, unless promptly arrested, it is sure to reach the stage of glanders in a very few days, when all hope of saving the animal may be given up. Glanders makes its appearance from four to eight days after the first showing of the symptoms.

The accompanying illustration is taken from a picture prepared by an English veterinarian, of a case which came under his treatment, at the Royal Veterinary College of London. It exhibits quite an extreme confluent condition of the farcy ulcers, the skin nearly gone and the leg swollen and dropsical. Yet, severe as was the case, the animal is said to have been permanently restored by the administration of antiseptic, tonic stimulants (aided by a judicious use of cantharides), which kept up the strength of the animal, and prevented the progress of the disease into the glander's stage.

Treatment of the Disease.

As the disease is very rapid in its progress, a good veterinary physician should be summoned at once. If it has made its first appearance in the form of farcy, there is hope, if prompt action can be had; for the disease is then wholly confined to the skin and lymphatic system. It affects the rest of the body only through general debility; hence the strength must be supported by stimulants and antiseptic tonics, as mentioned above—such as wine, ammonia, ether, etc. Iodide of potassium and iodine have been successfully employed at this stage of the disease.

If, however, the indications of farcy continue for any considerable time, the blood carries the poison through the entire system; and when the lungs and nasal organs are affected, the case is hopeless, and the animal should be killed at once, for reasons already stated, and to put him out of misery. The average duration of the disease is from fifteen to twenty days; although it sometimes proves fatal in a week.

We are not aware that either glanders or farcy have made their appearance in California; but their presence has been quite common, for a few years past, in the Atlantic States; and every owner of a good horse should be on his guard against putting him in a large, illy-ventilated stable with strange horses. No doubt the clear and invigorating atmosphere of this coast has much to do with the immunity which is enjoyed here from this and similar diseases to which this noble animal is elsewhere subjected.

Blooded Fowls.—Much attention is being paid to the introduction of blooded fowls into California. The Los Angeles *News* says that Joseph Babcock has recently imported eight pullets and three cocks—magnificent and perfectly pure specimens of Brahma Pootras. Four pullets and one cock cost $100 landed in this city. These chickens are to be carefully kept in an enclosure by themselves, for breeding, so that their blood may be kept untainted. This breed of fowls combines most excellent laying qualities with large size and weight, tender flesh and quiet habits. We judge, from the description in the *News*, that they are of the light variety. This breed of fowls is at the head of the Asiatic list in regard to size and weight. They will often reach twenty-two to twenty-six pounds a pair.

The *News* spells the word "Brama-poota." They take their name from the country where they originated, and geographers differ as to the orthography of the name—some spelling it Burrampooter, others Brahmputra, and others still Brahma Pootra. The last is the spelling now most generally adopted by the best authorities.

Diversified Farming.

The climate and soil of California is so varied that almost everything which the earth produces, can be raised here with great success. All the cereals, vegetables of every name and description, fruit of every variety, not excepting the tropical orange, olive, fig, lemon, pomegranate, prune, date, banana, etc., can be raised in almost every portion of central and southern California. The grape for raisins and wines and the mulberry for silk flourish here in their greatest perfection, and no land or climate is better suited to the culture of the poppy for opium. Experiments have already quite fully shown that we can produce our own tea, while coffee will eventually be a certain success in the lower portion of the State. Our mountains, while they abound in almost every mineral known to the arts, furnish herbage sufficient to produce all the wool needed to clothe our forty millions of people, and water-power for its manufacture into cloth. The navies of the world might also be constructed from the timber which crowns their slopes.
